The simplest way to make a microphone is to use a speaker! Thats right any old speaker will do, but the better performance comes from modern speakers. The bass response is superb, it actually puts to shame the audio of those guys on 14.178 using million dollar everything. Try it you will be amazed. It works really well on the older Kenwood radios like the TS5XX, TS8,xx series of radios. You may need to build a small op amp or low noise transistor pre-amp on modern radios. Only problem with this device is that it is large, you cant see the rig when talking. You get amazing results with large 8 inch and 10 inch cones.
But as for quality i would give it a 10/10.

Good stuff is a product called MicroMesh polish. This is what they use to remove scratches from aeroplane windows.
Joulers rouge also works, as well as machinist fine rouge for polishing metal.

Clifton,

It's possible the other smaller winding on the loop is meant for the transistor base, but most likely problem is improper device biasing. You are "saturating" the device for Beta's of 100 or more. Some form of Bypassed Emitter resistance is needed. Try .1uf across a 560 ohm emitter resistor to start. Adjust the Emitter
resistor such that the Collector voltage is approx 4.8 to 5VDC to ground at the collector.

This should get you out of saturation and into a linear RF amplifier mode.

Hi Cliff,

Hmmm...as you've described it, I don't see any DC return path for the diode, except for its own leakage current. I'd guess the diode is supposed to change the bias on the transistor, for either simple AGC (but it's facing the wrong direction for that...) or to optimize the operating point as a detector. But in any event, with no DC return path, it's not going to do much of anything!

Cheers,
Tom

>

It's a 'reflex' rceiver. The audio from the detector diode is fed back to
the first transistor and amplified (at AF). The same transistor is
amplifying both RF and AF - it saves a transistor stage. Reflex receivers
used to be very popular over 40 years ago; I built a couple myself and they
worked very well. Regeneration (positive feedback) was also popular, and
often used togther with reflexing for added gain and selectivity.

The biasing for that first transistor is probably wrong for that particular
device. Check the collector voltage, it should be about 4.5 V. If it isn't
try changing the bias resistor to get the voltage about midway between
supply and ground. That should cure the clipping.

I don't have any specs for these units either, but usually the
oscillators tune at something on the order of 20 MHz/mA on the main
tuning coil. You won't see any output at all until you put enough
current through the coil to approach the unit's lower frequency limit;
e.g. 100 mA for 2 GHz.

The main tuning coil will probably be the one with the lowest DC
resistance. There may be a heater element as well, but it (along with
the FM winding) can be left for later identification. Vcc on the
Avantek YIGs I've seen is in the +12-15V range.

I think Agilent owns Avantek these days. You might give them a call, it
couldn't hurt.

9. How NOT to cut a piece of copper tubing

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-01 03:08:44 UTC
From: Mike Monett <mrmonett@yahoo.com>
Message-ID: <3C31283C.75FB@yahoo.com>
Source record: 47651

To all,

Small jobs can turn into disasters if you let them. Here's how mine went.

I needed a 2 inch piece of 3/16" copper tubing to mount two light bulbs for my stereo zoom microscope. The halogen bulb burned out and I was darned if I was going to give the supplier another $32 for a replacement, especially when it died so quickly.

WallMart sells GE 40 watt spotlight bulbs for CAN $3.98. I bought two, plus a dimmer to adjust the light level. Two light sockets cost CAN $0.75 each, and I figured I would have a lifetime of use with a simple, cheap replacement.

I did all the eningeering stuff. I plugged one bulb in and let it warm up while I ate dinner. That took 20 minutes. I figured the bulb temperature had stabilized and I touched it.

Not too bad. My calibrated thumb and finger showed it was slightly above the 140 degrees F that I normally use for go/no go thermal decisons. Actually, the hissing sound from my fingers told me it was quite a bit above, so I let go quickly.

On to the next step. I placed one bulb in the optimum location on the microscope and checked the illumination. At maximum zoom, there was plenty of light, and moving the bulb had very little effect.

Things were looking up. If I ran two bulbs on each side of the microscope, my fingers could not get in the way and shut the light off while I was soldering.

Even better, if one bulb burned out, there would be plenty of light from the other, so I could continue working until WallMart opened and I could get another bulb. At 10% of the cost of the halogen, I would be grinning all the way.

Since I really didn't need 80 watts of illumination only 4 inches from the work area, I could adjust the dimmer to reduce the level, and the bulbs would last forever.

The plan is working perfectly so far. On to the crucial step.

I measured the distance between the bulbs. If I cut a small piece of copper tubing, I could solder to the socket pins and just let the bulbs hang from the microscope mount. Two inches would do it.

This is when the plan started to fail. I took my handy dandy tubing cutter, which unfortunately had a recent experience with a solid stainless steel rod, so it was not quite as sharp as before.

But copper tubing should be easy - right? Well, I tried but things went very slow.

I decided to speed things up by chucking the tubing in my handy electric drill. I figured I could control the speed well enough with the trigger adjustment to make a clean cut.

Things didn't quite work out the way I planned.

I had to hold the cutter with my right hand. This left my left hand free to control the drill and adjust the speed.

I rested the drill in my lap and applied power with my thumb. I had no idea what was to come.

Within milliseconds, the drill somehow advanced to maximum rpm, and I let go of the cutter out of surprise.

Bad move. The weight of the cutter on the end of thin copper tubing going at a zillion rpm quicky forced it off-balance. I now had one-half of a small propeller with a weight on the end, going as fast as the drill would go.

I couldn't release the trigger on the drill. It moved into my thumb.

The end of the copper tube found my shirt. Things deteriorated very rapidly from there.

Actually, it wasn't so bad. Except for a ruined shirt and blood all over the microscope. The doctor said the stiches will be out in a week or so.

There are many examples of poor use of power equipment. But I hope you will never experience such stupidity as I just demonstrated.

Have a Happy New Year!

Mike Monett

I have an AO Series 11 trinocular, and you stay the Hell away
from it! At least the 'scope should clean up pretty easily, and
shirts are cheap.

I'm really glad something Much Worse didn't happen.

My boss, some 20 years ago, was trying to drill a rivet out of
a boatanchor chassis. The rivet held down one end of a stiff wire
dingus. He had drilled the rivet out of the other end, and so it
started whipping aroud -- rivet and wire both, and this meant he
wasn't getting any farther on drilling the rivet out. When he put
his left index finger down to stop the wire, it whipped the whole
end joint of that finger off, a little bit at a time, but _very_
fast.

I had never thought about that particular failure mode until
then. Now I try to think about _all_ the ways something can go
wrong if I fsck up, and use the least risky one.

Goodness! The sigmonster was reading along. Look what it picked:

It's funny they'd release the product this way. Very weak stations (like
the 5 KW station 20 miles from me) won't come in without the diode, but
stronger stations are much less distorted without it.

I have no idea what was in the mind of the designer. I hate when that
happens.

Hi Mike,
I imagine it wasn't so funny for you but, well, you made me smile.
I myself had some unpleasant encounters with power drills too, but
I wasn't so bold as to tell the whole world ;-)
^--too many "Is" in one line vertical here
The lamentable accident aside - I doubt that dimming halogen bulbs
extend their lifetime. The lifetime of halogen bulbs is AFAIK extended
compared to normal bulbs by means of the halogen cycle, which
condensates the evaporated metal of the filament onto the filament again
instead of onto the glass bulb. To make this cycle work the glass bulb
has to have a certain minimum temperature which is considerably higher
than normal light bulbs. To my understanding dimming the halogen bulbs
results in bringing the bulbs back to normal operation, disrupting the
halogen cycle. Of course dimming the bulbs would otherwise extend the
lifetime as it does on normal bulbs. But doesn't dimming do harm to the
"chemistry" of the bulbs if used over extended periods?
Just my thought...
Hope you will recover soon and completely.

Regards, Ike

This is why one of the first lessons you get when working with barbed
wire is, "if you have to hold it while it's being stretched or
attached to the posts, use those big pliers." I have a small scar on
my chest to remind me that it's not a good idea...two inches closer
and I'd have gotten a good look at my rib cage.

Thank God Mike your relatively OK..... I have had similar things happen and now only use clamps with the drill press or Vise-Grips. Harbor Freight sells a nice drill clamp Vise-Grip hybrid that works very well. The closest tool to disaster that I have found it that circle cutter with the tool at the end of a bar and an adjustable radius. I have tried to use this on various materials all ending in mayhem to some degree or another. I guess it would be OK to drill a hole in a holiday Jell-O center piece or something like that. God Bless 73 Tom KI3R Port Vue nr Pittsburgh

I have an extra one (can't remember if 7- or 9-pin miniture) you can have for
$7 plus postage.

hi mike < I always tell the employee's to let the tool do the work, I had one fellow using a power drill and a 1/8 bit to drill out a bus bar. he put great pressure on the tool causing the bit to break and jump over and drill thru the back part of his hand (ouch). these tools will kill ya.

"I rested the drill in my lap and applied power with my thumb. I had
no idea what was to come.

Within milliseconds, the drill somehow advanced to maximum rpm, and
I let go of the cutter out of surprise."

I thought he was about to one-up my torsion of the testicle story....

One cannot be too careful.

Best wishes to all for a safe new year.

Clyde

You were quite right about 6 meters for the last 5 days. Condx have been terrific from just my mobile station with a 1/4 wave vertical and 100 watts in Virginia USA.

I've been working Europe and the Carribean quite a bit. Even heard a JY9 (Jordan) today on 6 meters but the pileups were too much for my little station.

I'm working on a project of putting a full wave horizontal loop for 6 meters on my truck (vehicle - automobile) while the Solar Cycle is at near peak and F2 DX is terrific.

Most of us tinkerers think we are smarter than our power tools. I'm glad Mr. Poster suffered minimal damage but its another reminder and we should take heed. One feels real stupid in the emergency room explaining these things.

Superb. I'm a TV/FM=DX monitor in Puerto Rico and am not catching any
signs of the openings. Can you suggest any times that you see these
openings?

I worked KP4 Sunday at about 1500Z from my mobile and 100 watts with a 1/4 wave vertical.

Europe has been coming in from 1300Z at the earliest until 1800Z or so at the latest. The times vary somewhat depending on condx each day.

I've heard some Carribean stations working Europe so just be on the lookout.

73 de N4SLR, Frank from a friend's computer.

29. Serenade software

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-02 07:44:52 UTC
From: "J.F. FOURCADIER" <jf.fourcadier@wanadoo.fr_NOSPAM>
Message-ID: <a0udn4$s2l$1@wanadoo.fr>
Source record: 47671

Hello to All

I have downloaded the student version of the Serenade software on the Ansoft website. This software seems
interesting and very powerful.

I'm wondering if it's possible to simulate low frequency circuits with this software (AF amplifier,
preemphasis cells, ...). The examples I have found within the package are microwave circuits with specific
functions and parts like microwave ports and lines. Where can I get more information and examples ?

Thank you for your help and happy new year !

31. electromagnet tuning fork use

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-02 19:30:53 UTC
From: c a l a n d e <rcalandeNOT@earthlink.net>
Message-ID: <3C335FD7.264FBA25@earthlink.net>
Source record: 47673

Iï¿½m trying to find out how an electromagnetic driven tuning fork would have been used in a radio.

This tuning fork was part of a huge collection of old radio parts that was received from a family friend in the mid 1960s. I left the tuning fork with a teacher in the early seventies.

The tuning fork was packaged in an aluminum can and included a pair of driver and pickup electromagnets attacked to the rectangular fork. When you drove it at its resonant frequency you got a nice pure sine wave output. I never truly understood how these tuning forks were ever used as part of a radio because of their low frequency.

Does anyone have any idea about hoe these tuning forks might have been used? Iï¿½ve tried to search the Internet for similar devices and closest thing Iï¿½ve found is an optical chopper.

4 pins in a paralellogram configuration?

any markings on it?

sounds like a Motorola 'vibrosender' or 'vibrosponder' "Private Line" reed

they were used to tone-modulate the radio so that several users could share a frequency and not have to listen to each others' traffic; each system would have it's own 'Private Line' frequency. the 'PL' would be disabled in the receiver when the microphone was taken off-hook.

This term caused created untold grief for us in the service end, the salesman would get the customer fixated on the 'private' aspect of it and then the first time the customer picked up the microphone in his truck and heard someone else on 'his private frequency' the crap wouopd hit the fan

frequencies ranged from about 85 Hz to almost 200, the 'original' was 100 Hz, later coded '1Z', and the frequencies went up and down in increments of 3.5%: 93.4, 96.7, 100, 103.5, 107.1, etc

there were 2 styles, the TU-217/TU333 used in the tube-type up thru Motrac style, and the TLN-6709/TLN-6824 used in later units (Mocom 70, Micor, Mitrek, Maxar, Moxy)

the TU units were about 3 x 1 x 1/2 inches, all metal construction and copper or brass colored, the later ones were about 1.25 by 0.75 by 0.50 inches and were plastic-cased with metal sides held on by 4 rivets in the corners.

hope this helps!

In a Trio tranciever by any chance?.
IIRC it was used as a feedback path in an audio osc. Noise at the
output of the AF amp was fed into the drive coil and the 'tongs' were
inductivly coupled back to the input. After a few seconds the thing
was rattling nicely.

From: Kurt Stocklmeir <kurtstocklmeir@worldnet.att.net>
Message-ID: <01c193e1$8524f140$6f284f0c@oemcomputer>
Source record: 47677

I am trying to understand how electrons flow through a wire. Many frequencies can travel through a wire and not interfere a lot with each other. Different frequencies will change direction at different times. Different frequencies can be going in different directions. I think a lot of current could be going in 1 direction and it tends not to cause trouble for electrons changing directions.

Thank you for answers.

I'm reverse engineering an RF device from the late 80's. It has two metal can's that I think are NPN silicon transistors. They have the following printed on 3 lines: NEC C1600 E88.

Can anyone help with basic info on these devices. I think they are NPN, with emitter near the metal can transistor tab and pins in order of E B C. The oldest NEC databooks I have do not list this one.

Electrons flow through a wire very slowly, I think like a centimeter in 13 seconds if I remember correctly.

The electric field caused by the current changes nearly the speed of light, depending on the conductor and other factors. Some cables propagate at .6 times the speed of light.

Many frequencies can be transmitted through the wire because it is a linear system. The different frequencies are additive.

You have much to learn and much to read.

Check out the ARRL handbook for starters.

Source record: 47686

General Radio used what is called a "microphone hummer" as a one kilohertz oscillator in the Type 650-A impedance bridge. They also sold a Type 723 "Vacuum-Tube Fork", which is essencially a fixed frequency oscillator used for test and measurement. the 723-C was 1 KHz and the 723-D was 400 Hz. These are listed in the 1956 GR catalog, which is the only one I have. I have no idea whatever if other companies made these type devices and also have no idea how one of these rascals could be used in a radio.

If you would like more info, the 1956 GR catalog and the manual for the Type 650-A impedance bridge is available for download at http://bama.sbc.edu/gr.htm .

One other note. I bought a 650A at a hamfest for next to nothing. I could tell from the filth that it had been treated badly. All of the controls were frozen and some of the phenolic shafts were broken. I cleaned it up and put the power to it and it fired right up. It is one rugged piece of gear. I have to slap it on the side sometimes to make the oscillator start!

Hope this helps.

I don't think so. I think it is two output stages to a mw-level
oscillator. These are smaller than TO-5. I could look up the
package if necessary. About the size of TO-5 but shorter.

They are clearly labled NEC. I doubt if this directly translates
into the 2SC scheme. Somebody tell me if I'm wrong here.

Well, NEC made a 2SC1600. I did a quick search on Google - there were quite a few listings and I didn't dig very deep. Punch in 2SC1600 and see if you can find something via that route. On many Japanese transistors the markings are this way (add the 2S) but thats no guarantee.

Here's what I found on the 2SC1600:
TO-46/EBC case. TO-46 is about 0.2" in diameter, flatter profile than a
TO-5
Vcbo 40
Vceo 20
Vebo -
ICa 0.25
Pcw 4.375
```

49. at what point will a germanium detector 'detect'?

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-03 05:37:11 UTC
From: hexter@blazenet.net
Message-ID: <u37rg7dj75jn55@corp.supernews.com>
Source record: 47690

I must phrase my question properly so as not to sound dumb. I would like to detect amplitude modulation using a germanium diode and an audio amplifier chain that can produce 80 db of audio gain to drive a set of headphones. I would like to connect the detector to the output of a narrow bandwidth preamplifier in the 15.5 mhz region (bandwidth 10khz at 10 db down). The preamp has a 100 ohm resistor to ground to set it's output impedance. I guess the best way to ask would be this, At what minimum dbm or even dbv (i can handle the math) referanced at 50 ohms can I expect to recover decent distortion free audio? Distortion free taken as meaning less than 5% THD on normal vocal audio frequencies.

This puzzels me, as I don't know how much drive it would take to get conduction, and additionally, how far into conduction I would have to go to get decent recovery of amplitude modulation.

BTW, the preamp is homebrew using 6AJ5 valves, and is producing about 40 Db gain looking from 50 ohm input to the 50 ohm output connector. (Both BNC)

Well, NEC really stands for "never_entirely_compatible" so you can't
presume much. Having said that, the implied_2S rule is almost
inviolate in Japanese product. This doesn't preclude packaging
variations.

Jerry

I used the MAX232 a few years ago to convert between TTL and RS232
levels
and it worked a treat.

Regards

HI all,

I have a quantity of Fujitsu PLL chips made in 1994, the MB87080A.
Unfortunately the Fujitsu site doesn't have data for chips back then.
Does anybody have an old printed data book or other source of data
with the information please?

Thanks in advance
Richard

These Maxim devices have been around for many years now and they work
as advertised. What is it that sounds to good?

The MAX202 is very similar to the MAX232, in that they are both dual
TTL to RS232 translators. The MAX202 uses smaller capacitors, 0.1 uF, for
the internal charge pump but has a slower data rate, 20 kbps. The
MAX232 uses larger capacitors, 1 uF, and can work at 120 kbps.
If you need the speed, go with the MAX232.

If you want a list of the various Maxim RS-232 Line Driver/Receivers
try:

http://para.maxim-ic.com/compare.asp?Fam=RS232&Tree=Interface&HP=Interface.cfm

You can sort on the feature that suites your needs.

From: Johnathon and Courtney Chihonik <chihonjcnospam@mb.sympatico.ca>
Message-ID: <3C347DFB.9B46486F@mb.sympatico.ca>
Source record: 47598

Hey there all, recently my (extremly cheap) Curtiss cordless phone bit the bullet and being the curious little monkey i am, of course, i tore it open almost immediatly.
Unfortunatly, my electronics experience ended at the end of grade XII (and that was 4years ago). so now that its apart i have no clue what im looking at. Anyways, i figured that a fm cordless phone would provide me with a bunch of basic radio parts being that it is a transmitter and a reciever for 900mhz. I assumed that there would be some useful xtals and a mixer/occilator of some sort, but now that its open i realized that i dont know how to read the numbering on the xtals and as far as chips go the only one i recognized was the 7805.

the xtals are 11.150 htl 14p, 5.1612 htl 20p, and 4,129 htl 30p
could anyone tell me how to read this in terms of hz.
also if anyone could identify these ic's i would be very grateful.

SFH615A-3 (4pins)
DBL5015V (20pins)
7324RP (14pins)

I also have one more ic laying around here that i dont know what it is, its from one of those little fm transmitters that you use to send stuff from your discman to your fmradio only car sterio. it is an: 2035 JRC A6004 A

Thanks in advance for any response,
J. Chihonik

> of current could be going in 1 direction and it tends not to cause trouble
> for electrons changing directions.

The same way that many frequencies at once can propagate through air,
as the movements of molecules of air. The wave motion or propagation is
a different thing from the movement of the molecules or electrons.
Similarly with waves on water- the wave propagation is different from
the movement of molecules, even though propagation depends on it. The
wave may travel many feet, but the movement of the molecules of water
may be only inches.
Now, at any instant, the velocity and pressure of the air, or the net
movement of electrons, at any one point, have only one distinct value,
but frequencies and waves are _patterns_ of movement, not the movements
themselves.
I remember reading an example that clarifies the difference between the
movement of an impulse and the movement of the medium in which it
travels. Imagine a long train, stopped. Then it starts, at a very low
speed initially. There is a clicking sound as the couplers pull up
tight, and this impulse travels down the train at a high speed,
depending on how much slack there is at each coupler. But the train
itself is only moving at a fraction of a mile per hour.

Source record: 47601

At low levels, all diodes operate in the "square law" regime, meaning
that if you demodulate with them, the output will be the square of
the correct voltage. To get the diode to operate linearly requires on the
order of a milliwatt typically. The exact level depends on the particular
diode characteristics and how linear is "linear". 5% THD is not all that
linear, so it wouldn't surprise me if a milliwatt was enough.

To get "high fidelity" AM demodulation, you should have several
volts of RF across the diode OTOH, if you are happy to be in
the square law regime, some state of the art "zero bias schottky"
diodes work down to -70 dBm.

If the part that sounds too good to be true is getting +/- 15 from a single 5 volt supply, that's the magic of a charge pump. You can do it yourself with discrete parts, but it's a pile simpler with one of the Maxxim parts. Like other writers, I have used the MAX232, and it required some large caps. One of the parts, I think it's still a 232 but with a different suffix, doesn't even require external caps.

With a bit of hunting around you can get them pretty cheap - well worth keeping a few in the junk box just in case. Heck, I had one situation where I needed a little negative voltage for an extended temp LCD, and the 232 was easier than futzing around making a charge pump.

Source record: 47603

Thank you for answers.

It is true many frequencies of sound can go through the air. I guess it can be compared to electrons going through a wire.

I was thinking it could be associated with different energy levels making up a metal. I think a conduction band has different energy levels. May be different frequencies find different energy levels for a path.

Current going in only 1 direction tends to spread out through the whole wire. High frequencies tend to stay on the outside of a wire. May be current going in only 1 direction is made to stay at the center of a wire and different frequencies spread out through a wire with the highest frequencies outside. I am not saying any of this is right.

There is not any good reason not to break up words.

Ok. I'm convinced. This must be what they are. The case seems to
match what I see in the board. I was thrown off by the power
rating, but there's no reason they can't be used in a lower power
application.

Thanks for all the help finding this information.

Hello all,

I'm looking for a ferrite rod made from Stackpole 24B mix or equivalent.
The u is around 2000. The rod is 0.75" in dia and 12" long.

This rod is to be incorporated in a LF beacon for location work.

I have searched high and low all over the Web and have turned up empty
handed so far.

Maybe someone here can help...

Thanks,
Erik

go to Maxim's web site they will send you two free samples of most products plus
application sheets can be down loaded. They will also send a full line catalog
on CD for free.

Great folks to deal with.

The crystal frequencies are as marked. 11.150 MHz, 5.1612 MHz and 4.129
MHz. If they are larger than a crystal ought to be, they may actually be
oscillators.

The 2035 is probably a date code, 35th week of 2000.
>
> Thanks in advance for any response,
> J. Chihonik
>
In general, these ICs are specialized and not standard numbers. In some
cases they are standard numbers but ordered to company specs and thus are
marked with a company number. It's anyone's guess what they are.

The most useful parts in the telephone probably are the microphone, ringer,
speaker, and battery holder. Maybe an LED.

Bob

This month my junk box is getting a bit thin. This is what I have as
available surplus.

Parts for Sale as of 01/01/2002
==========

Caps
====
NEW .1 uF Poly/Film caps - 10% 250v, new stock, paper tape, nice
long leads. These are not NPO and are made by S&M Components
50/$3.00 or 100/$5.00

NOS .01 uF ceramic caps, 10% 100v brand new by Kyocera
50/$3 or 100/$5

NOS 1000pf blue mono caps, 10% 100
50/$3 or 100/$5

NOS 470pf ceramics on paper tape, rated 5%
50/$3 or 100/$5

NOS 12pf NPO ceramics on tape
50/$4 or 100/$7

22uF 35v electrolytics These caps are on paper tape, NOS (New, but old
stock) made by Richey.
100/$2

Connectors
==========
I have NEW BNC chassis connectors for (includes nut and lock
washer)
==========
25 for $14.00
50 for $24.00
100 for $40.00

Voltage Regulators
==========
LM7805C voltage regulators. TO220 case. 5 for $4.00
L7806CV voltage regulators. TO220 case. 5 for $4.00
LM7808CT voltage regulators. TO220 case. 5 for $4.00
LM7812T voltage regulators. TO220 case. 5 for $4.00

3 of each for $10 (12 total VR's)

Key/Headphone Jacks
==========
These are 3.5mm female stereo PCB mount jacks. Can be used in
ugly/manhattan building projects with no problems.
3/$1.35 (or send a buck and a stamp)

Transistors
==========
2N2222A'S in plastic TO92, NPN - 50/$4.50 NEW PARTS
2N3906's plastic TO92. PNP - 50/$4.00 NEW PARTS
2N3704's plastic TO92, NPN - 50/$4.00 NEW PARTS

I AM OUT OF METAL 2N2222'S!!! BUMMER!!

IRF540's TMOS Power FET, N-Channel, 27A, 100v RDS(on) = .070 Ohms
http://www.onsemi.com/pub/Collateral/IRF540-D.PDF for data sheet
$1.00 each.

BC847B - Surface Mount NPN's, general purpose
CBO = 50v, CEO = 45v, EBO = 6v, Collector Current Max = 100 mA,
electrical characteristic curves for this unit are the same as the
PN2222A, SST222A, MMST2222A, and UMT222A transistor. These are new
stock, on SM tape.
100pcs/$2.50

2N7200 MOSFET - 5/$2 10/$3.50

Crystals
========
3.579545 Mhz Crystals for 80m - These are pulled colorburst crystals,
2/$1

POTS - USED
==========
10K 1 Turn Panel mount pots. These are pulls. No knobs, just
shafts. Most are Allen Bradley. Pot is about as big as a quarter.
With nut. 5/$4.00

Diodes
======
1N4148 - You always need these. 75 for $2.00 These are NEW.

Let me know if you're interested. All prices are post paid to the
USA, unless otherwise noted. I will ship to non USA addresses but we
need to discuss the shipping charges first.

Of course, you will find some cool parts, and more valuable than "LEDs and
speakers".

That 11.150MHz crystal for example. Since that frequency mixed with
10.7Mhz results in 450KHz, it's pretty certain it's there to convert
the 10.7MHz IF to 450KHz. That can be a useful frequency, and from
time to time people do ask where they can get them (and I suggest
a cordless phone). And if those are the IF's, then there's bound
to be a ceramic filter at 10.7MHz (though probably nothing too narrow;
consumer electronics tend to use FM broadcast-band type filters
there, for economy reasons, merely to make sure that 10.7MHz is
the only signal passed onto the next IF stage. And there will
be a 450KHz ceramic filter, of a bandwidth suitable for narrow
band FM. Maybe not useful for many, but if you want to build
an FM receiver or adaptor, it's a great source for these
components.

In fact, one could just extract the whole FM IF strip from the
unit, and transplant it somewhere else. I don't know about
900MHz cordless phones, but the 49Mhz units that I've bought
for parts at garage sales ahve used identifiable ICs for the IF
strip (and, in fact one IC that takes 10.7MHz at one end and
puts out audio at the other end). Even if they aren't recognizable
numbers, sometimes it's worth tracing out a bit of the circuitry
around such ICs (the filters should be recognizable, and they'd
be in the vicinity of the IF IC), and then check data books to
see if there's a match on pinouts. Motorola made ICs for these
applications, and I've found them in various consumer items; later
generations of equipment may have gone to more obscure devices,
but maybe not.

I've never seen the insides of a 900Mhz cordless phone, so I
can't say what else you'd find in there. Cellphones will have
similar FM IF strips, and VCO modules, and usually definable mixers
(and prescalers that work up into the UHF range); at least, if

you go for the ones that are old, bulky and cheap. I found a satellite receiver a few weeks ago, and it had a nice diode ring mixer.

But looking at the ICs that Maxim produces, I can see how the UHF stuff might be done in fairly integrated ICs that might not be recognizable, and might not be useable except for the intended application, due to the high level of integration.

Do a websearch on the ICs (make sure you've got the IC number, and not the date code). I've taken things apart, found ICs that look like they might be useful, and found some information by going to yahoo or google. I've found information about prescalers that way; I could figure the pinout from the circuit board, but I needed to know the division ratio and sometimes such information has popped up not at manufacturer's sites, but at distributors websites. Or once you have a ballpark bit of info, ie this ones for the IF strip, then you can judge whether it's worth doing some more searching. It's often best to keep the circuit boards intact, until you can use the parts, because you can gather information from tracing the circuits.

You aren't , by chance, looking to build Brian Pease' 3,496 Hz beacon are you? If you are, search for "Stackpole 24B" on Google. He gives a couple of email addresses for himself. Why not email him and ask him where he got his 2000u .625"x12" "Stackpole 24B" ferrite core. By the way, how much power do you intend to put into this thing if you ever find it?

Good luck,
Tom Donaly KA6RUH

I have done some work in designing simple antennas for emergency communications on 2-Meters.

This is a link to my Ham page: http://people.ne.mediaone.net/buck0/hampage.htm
It contains designs for 4 different 2-meter collinear antennas, a 2-meter SSB Halo, and some information on Go-Kits.
The ARRL Website also has a link to this page located:
http://www.arrl.org/tis/info/Yagi-V.html

This HALO design is not ground dependent and can be mounted atop a section of PVC. See comments! Easy to build. Cheep$$$

Some of my antenna designs are posted on the Erie County Chapters of ARES and RACES Website:
http://hamgate1.sunyerie.edu/races/antenna.htm
The ARRL Website also has a link to this page located in their Technical Information Pages: http://www.arrl.org/tis/info/JPole-V.html

Have fun building!

I did about seven years ago. It was an old audiovox trunk mount unit. I used the RF board out of it. It made good power at 902-928 Mhz. It had dual synthesizers one for TX and one for RX. I used a Motorola MC68705 processor to do the data loading into the loop dividers. I already had a development system for the ' 705 series parts. I went with low side injection for the RX. I may have had to change a chip cap or two in the VCO's but I cant remember. The original ceramic duplexar was disgarded. This left the front end wide open so I used a 3 section apeture copuled filter I got at a hamfest for RX and TX flitering and a coaxial relay for switching. A box with led
freq display and up-down freq switches and
a repeater offset switch and Mic preamp and connector made up the control head. It made about 5 watts with the power control all the way up. RX was about .3 sinad. I still got it but my 900 repeater is history as no other brave souls would attempt to get on.

Very neat for the lazy constructor :-)

I'll stick to my cheap asian knock-off nibbler + chunk of PCB for now.
If I ever get sick of cutting up bits I might buy it though. Are they
snap-off? I must admit that I find sitting and listening to the radio
while punching them quite theraputic, but a bit painful on the hands
after 50 or so.

Thats the most common one used lately I think. The MAX232 is used for
many of the ci-v converters for icoms, etc, etc. I think it's possible
they even sell that chip at rat shack. I've heard they did anyway.. MK

My method is to use toothpaste and the end of my index finger. I've done this many times, and it works great. Is a bit time consuming though if the scratch is deep. I just put a small dab of toothpaste on the end of my finger, and then add a tiny bit of spit or water and start rubbing it in. I usually go in circles. This will work, and when you get though, the crystal will look shiny and just like brand new. I last did this a few months ago when an ignorant dweeb sprayed OFF on my TS-830 at FD. It stained the clear glass in front of the display. I used the toothpaste method and after about 20-30 min, the plastic looked like brand new. You can't tell it was ever touched. And if you look at it with the light shining, it's shiny on the surface just like new.
I even did this on the speedometer crystal on my old 68 ford truck. I took a bad scratch about 90% out. I could have took it all out, but I got tired of rubbing. Anyway, this method may sound a little rinky dink, but it works great. Will make that plastic look BRAND NEW if you do it long enough. Also I've never had a problem with extra scratching of the plastic with toothpaste. It's just right as far as grit. I wouldn't waste any money on special stuff. The toothpaste will work just as well. Just takes a bit of time rubbing. MK

The 'Copper Island' system is intended to be far neater than 'ugly'
construction,
where IC's are usually positioned 'dead-bug' fashion, I seem to recall.
My excellent sales figures would disagree with anyone who may think this
technique is not
popular amongst constructors, simply because all the hard work of preparing
the pads
has been done, making it very attractive to enthusiasts who like to 'roll
their own', but who
would prefer to get building instead of sitting around sawing and chopping
up rough bits of board beforehand.
The pads in my outfits are all machine cut and finished.
For those constructors who like to produce traditional printed circuit
boards,
my system is ideal for the prototyping or 'breadboarding' stage of design,
in fact I have received enquiries from schools and other educational
establishments who want to use my system in their electronics classes.

This has been called Manhattan style construction over here,
check out http://www.qsl.net/k7qo/manhat.htm.

This kit could be of use to people who are workshop limited, but still
want to build their own circuits. There have certainly been times in
my past when something like this would have been highly desirable.

I applaud this effort, and have posted a pointer to it on the QRP-L.

How much for a kit shipped to the US?

In fact, electrons in the conduction band of a metal are considered to be like a gas, with the electrons moving so freely that they are interchangeable. And in free space, many colors of light coexist, even if there is no gas there.

> I was thinking it could be associated with different energy levels making
> up a metal. I think a conduction band has different energy levels. May be
> different frequencies find different energy levels for a path.

No, that's not right, any more than that different frequencies in air find different gas molecules to go through. All frequencies going through a wire at any instant add up linearly to a single instantaneous voltage and current.

> Current going in only 1 direction tends to spread out through the whole
> wire. High frequencies tend to stay on the outside of a wire. May be
> current going in only 1 direction is made to stay at the center of a wire
> and different frequencies spread out through a wire with the highest
> frequencies outside. I am not saying any of this is right.

The reason high frequencies stay at the outside of a wire is that the rapidly changing electric fields can't exist deep within the wire- they need to be close to the free space at the outside of the wire. But unidirectional current, once established, is uniform throughout the wire. As far as I understand it, none of this has to do with different energy levels of electrons, except that those that make a metal a conductor are all in the conduction band.

You should probably forget about various media to study waves and frequencies. It's all similar, whether in air, water, an electron gas, or free space. Waves and frequencies are patterns of change, not movements themselves.

Source record: 47631

Some problems with a diode envelope detector, giving rise to unwanted harmonic distortion are:

1. Threshold voltage - a voltage typically 0.2V for germanium is needed to get the diode to conduct.

2. Diagonal clipping. The RC filter after the detector used to average out the IF frequency components does not always follow the negative signal transitions.

3. Sideband symmetry. The diode envelope detector is (for some reason) intolerant of phase imbalance between the carrier and sidebands.

I was able to get hold of a paper on the internet which models (theory and practice) the distortion generated by a diode detector. The THD generated at modulation levels of 50% are 0.4% and for 100% modulation are of the order 2%.

Some time back I designed and built a synchronous AM detector - this works by using a PLL to generate a local carrier (phase-locked to the incoming carrier) and multiplying that with the incoming IF signal. Although complex to build, one can switch between the usual envelope detection mode and the sync mode and compare the sound quality. The sync mode is much more pleasing to listen to. I don't know what the THD performance of a synch detector is, but it overcomes the problems mentioned above with conventional diode detectors. It seems to be much more tolerant of sideband assymetry (eg. that grating distortion you get during receiver mistuning or fades).

Disadvantage of the sync detector is that it contains nearly as much electronics as the average superhet radio. I'm glad I built mine - learnt a lot in the process. There are some designs on the web and in the ARRL handbook which look possible.

One thing worth remembering is that you should get pairs of parts from
this. Whatever is in the remote, should be more or less mirrored in
the base unit. This may not be completely true, since at least
one of the 49MHz cordless phones that I've taken apart used different
parts in the base and the remote, but since you need the same RF
equipment in both, it makes sense that they'd be using the same parts.

Source record: 47633

Different frequencies don't travel separately. Complex sources simply all add and subtract together at any single instant at any single point in space. At any one instant, there is only ONE value, whether it is rendered as voltage, pressure, current, electron flow, sample value on a CD disk, deflection of a microphone diaphragm or speaker, location of the trace on an oscilloscope.

You can actually see this on an oscilloscope display (or on an old black vinyl record if you can find one!).

Stereo is where you take two separate locations in space and sample them simultaneously to produce two information streams.

I'm wanting some copper laminated board about 200mm x 300mm size and perhaps even larger. I've never used this before and wonder if any homebrewer out there can recommend a good place to obtain this product in the UK. I know Maplin & RS sell this stuff, just wondering if there are other vendors offering maybe a better deal or whatever. I see different variations of laminated board is made, I'm just after your regular common-all-garden stuff (whatever that designation is, anybody know?). Thanks.

I'm new to copper laminated board consruction. Mmmm, the idea of physically cutting out the copper to leave "islands" or "pads" is pretty neat. Would be nice if one could make rectangular "pads" using some tool. Anybody know of anyone selling tools (apart from the drill-mills") and/or techniques useful in creating round or rectangular pads in these copper laminated boards by cutting out the copper?

G4DFV's system is okay as well.

Rectangular is kinda hard I'd imagine?

Perhaps you could do it carefully with a grinding bit in a dremel tool
style device? It would be rather time consuming though. Probably
easier to cover the entire board with making tape, and cut out the waste
masking with a scalpel, then etch the board.

For circular, a device like hole-saw without the guide drill would
work. When I read your first post I was thinking about filing a few
teeth into the end of a steel tube and trying that in the drill press.

I use a nibbling tool myself, I punch about 100 little chad things and
put them in a dish, like a jam lid or the bottom of a coke can. Then I
just pick them out as needed and with a single drop of super glue, stick
them to the copper clad ground plane as required.

(OT: anyone else notice that a coke can bottom makes a pretty
reasonable 'dish' for 10 or 24 GHz beacon/test transmitters? You just
run some L or S band RF on some minature hardline up to a good microwave
diode mounted at its focus with a small copper disk to backfire the
radiation towards the Al surface.)

Duncan's pre-cut DIP layouts are damn nice though. WA6OTP has
something similar on his website: http://www.wa6otp.com/new.htm I
gather he has made up a cutting jig and does it with an electric saw?
(I still adore that blokes PTO idea, it really works well).

You're writing to a world-wide newsgroup, but I presume you mean "in the
UK."

The cheapest source is at a rally (US: hamfest), where you can usually
find someone selling scrap ends of board, but we're somewhat out of
season.

Maplin, RS and Farnell are OK for small quantities, but you pay for the
privilege. Mega Electronics are much better for larger sheets, and all
kinds of PCB-making materials. All addresses are on my website in the
'In Practice' section.

However, before trying any of those, look in Yellow Pages for 'Printed
Circuit Services', find someone local and give then a call - they're
bound to have lots of offcuts.

Can anyone remember how to decode the coloured bands TI used
to mark their small (300mW ?) Zener Diodes years ago. I've got a pile in my
junk box marked Brown-Brown-Brown, Brown-Orange-Brown & Orange-
Orange. I think it was the same as resistor colour coding but that would
make the BBB & BOB 110 & 130v respectively & my DC PSU will only give
me 60v so I can't check w/o making up a jury rigged PSU.

Thanks for reading the e-mail

Do you want the resist coated stuff, or uncoated?

The best stuff I've found is the paper composite with thin fibreglass. It's
quite cheap and very easy to drill and cut, and comes single- or
double-sided with resist. Not as stable as proper FR4, of course, but fine
for prototyping. Farnell stocks it, as does Mega. I see from their latest
catalogue that ERS now sells it: http://esr.co.uk

Maxim seems to have a lot of different variations on this chip, with different packages, speeds, voltages, and configurations with different numbers of drivers and receivers. There must be dozens to choose from, so check their web site.

By the way, they even have at least one model that does not even require external capacitors for the charge pump, but it costs about $5 (US) instead of about a buck. I used a few of these for a project at work a few years ago and they seemed to work fine, though they are probably not cost-effective for home projects. I only used them to reduce parts count, speed up fabrication time (hand-wired), and hey, they government was paying for it anyways (your tax dollars at work, thank you very much).

Hello to all
I am building a high voltage power supply for a 4-1000 amp which is about 90 percent completed. But I could use a little help with the high voltage meter shunt. I have a 0 to 50 milliampere meter that I want to use with this power supply.
this power supply has an output of 5000 volts. now here is my problem, I don't know what value of resistor to use for the shunt. My math skills are quite poor so I am unsure about how to figure out the shunt value ect.

Thank you

Hello Jim

Is this for measuring the VOLTAGE? If so, you don't want a shunt,
you want a series resistor in line with the meter.

But, remember all currents in a series circuit are equal. At 5,000 volts,
you will need a resistor with at least a 250 watt rating to serve as the
shunt. That is a considerable waste of power. P= I x E. Or,
P = .05 x 5000, 250 watts to have the meter read 50 mA at exactly
5000 volts.

Since the the meter resistance will be negliable, just use ohms law
for Resistance to figure out what value of R is needed to draw 50 mA
at 5,000 Volts.

Pete

A meter shunt goes in parallel with the meter and is used to increase the full scale current of the meter. To calculate the shunt you need to know the full scale current (which should be about 1/4 more than the normal plate current you want to read), the value of the meter (50 mA in your case), and the meter's internal resistance.

If you want to use the meter to read the power supply voltage then you need a meter multiplier (a resistor in series with the meter). You just use ohms law (R = E / I) to calculate the multiplier resistor BUT you must also be concerned with the amount of power disipated by the resistor and the maximum voltage rating of the resistor. To drop 5000 volts at 50 mA, your resistor is going to disipate 250 watts - way to much for a metering circuit. You need to find a much smaller meter; 1 mA for example. A multiplier resistor meter based on a 1 mA meter will only disipate 5 watts. You can series a number of smaller value resistors in order to limit the voltage drop across any one resistor. Technically you should subtract the internal resistance of the meter from the multiplier resistor value but it is likely small enough not to cause a significant error.

Like the current meter, the full scale reading of your meter should be around 1/4 greater than the anticipate supply voltage so that the meter normally reads about 3/4 scale.

Gee, the ones I have in my junque-box are in the 1N7xx series
(mostly), and the colourcode is violet-x-x, just dropping the 1N part.
But obviously (?) you have something different. You could perhaps
rig up a higher voltage tester by rectifying your mains voltage, with
a modest filter capacitor (with appropriate shunt bleeder resistor),
and feeding the diode under test through a high-value resistor,
perhaps 100k ohms or so (thinking that if you rectify your 240V mains
you'll get around 300V...) Be careful, of course, but if you wire
things up and measure voltage with a meter which is independent of the
mains and just plug the thing in and read the meter from a distance,
it should all be safe.

Cheers,
Tom

You can use the meter to measure the current drawn from the power supply. If you want a 500 mA full scale reading you will need a shunt which is 1/9 the meter resistance.

However meters are usually wound with copper wire and thus have a considerable temperature coefficient of resistance. A better way would be to use a shunt that provides a few volts for the meter circuit, then use a series resistance with the meter.

However if you wish to measure the Voltage of the power supply, the 50 mA meter is too insensitive. Better to find a more sensitive meter and put a series resistor with it to the high tension lead. Wasting 50 mA for the measurement is poor practice. One milliampere is the most you should draw, and perhaps less. Find a 200 microampere full scale meter to do the most conventional job. For 5 kV full scale, you will need 25 megohms of multiplier. But it needs to be a high quality resistor or the reading won't be accurate. Good practice requires shunting the meter with a high resistance so that if the movement opens, the tail end of the series resistor won't be at 5 kV and thus arc within the meter.

Source record: 47555

You "Don't" use a "shunt" for a voltmeter... You use a "series" meter multiplyer... A "shunt" is used to increase a current meter for a higher range... Normaly use a 0 to 1 ma meter, Put a new 0 to 5000 volt scale on it, Then use 1 meg per Kv for the multiplyer.. Be CAREFUL, It sounds like you may not have the experience needed to work around HV and hi power amps/Power supplies. Regards Sparks W4EAS

Hi,

I have a need to coupling a VoIP device to a CO Line so that
incoming calls will/can be forwarded to the CO line to make
out-going calls. I know Radio Shack used to carry such a device
back in the 70's; however, it has since been discontinued.

If you know where I can get or know how to build such a device,
it certainly would be nice if you can please post the response
to this NG or e-mail to me at "mazilo @MSN. com" (no spaces).

TIA.

AMATEUR RADIO NEWSLINE(tm) REPORT #1273 - January 4 2002
(Total Running Time with RAIN Promo: 24:48)

==========

A NOTE TO THOSE WHO ONLY “READ” AMATEUR RADIO NEWSLINE(tm)

For those of you who only know of the Amateur Radio Newsline (tm) as a text newsletter we would like to invite you to listen to the audio version. This Amateur Radio Newsline (tm) script is actually written for the “spoken word.” It is recorded each by professional broadcasters and is available for private listening or rebroadcast over your repeater. Three methods of delivery are available: Streaming audio using RealAudio, FTP RealAudio, FTP MP3 or dial-in telephone. Please visit our website at http://www.arnewsline.org for a list of telephone numbers (you have to pay your own long distance charges) and links to audio servers providing our voice newscast. On site free FTP Downloads are available at our site by clicking on the newscast number at the top of the page.

de
The Newsline Production Team

==========

Amateur Radio Newsline report number 1273 with a release date of Friday, January 4 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T. A “V-E team” finds a way to test kids in one of the most remote regions of the country and the FCC again says no to expanding PRB-. These stories are first on Amateur Radio Newsline report number 1273 coming your way right now.

(Billboard Cart Here)

HAM RADIO TESTING REACHES WHITE MOUNTAIN ALASKA

Ham radio examinations have finally come to one of the remotest areas of the nation. This, after a team of examiners from the W5YI VEC perform a fly-in examination session in White Mountain Alaska. Amateur Radio Newsline’s Norm Seeley, KI7UP, has the details:

--

White Mountain is a remote fishing village in the far North-West of Alaska. It’s major claim to fame is that its the next to the last checkpoint for the famed Iditarod dog sled race. And it wanted someone to come in and give ham

radio exams.

The closest big city is Nome. White Mountain is only about sixty miles from Nome but its over some rather treacherous terrain. There are no roads in or out and all supplies to White Mountain have to be delivered by plane or boat.

But White Mountain does ham a ham radio operator for its mayor. He is reindeer farmer Tom Gray KL0CQ. And one of its school board members is Eric Morris KL7HT. Both will tell you that a temperature of minus 40 degrees Fahrenheit and a wind-chill factor of minus 100 degrees is not uncommon in winter. These were the conditions faced by a four member W5YI VEC test team when it chartered a plane and flew in on December 11th to administer exams to four adults and fourteen youngsters who were determined to make ham radio a part of their life.

The trip which cost $800 for the flight alone was sponsored by the Seward Peninsula Amateur Radio Club. Braving the weather were examiners Ramon Gandia AL7X, Michael Nurse KL7UJ, Scott Webber AL7RJ and Thomas Busch NL7H. Al four are from Nome. Most of those to be tested came from the Bearing Strait School District’s only inland school. They had all been studying for their Amateur license as part of a search and rescue course. Neither the applicant or the VE team were disappointed. All eighteen passed the Technician class exam.

For the Amateur Radio Newsline, I’m Norm Seeley, KI7UP.

--

Those involved in ham radio testing are keenly aware of the problems faced by remote areas of Alaska. At last July’s VEC Conference in Gettysburg Pennsylvania Jim Wiley KL7CC told the group that many applicants in Alaska are denied n Amateur Radio license exam due to the inaccessibility of their locations or the high cost of travel in that state. (W5YI)

**

HAM RADIO AND THE LAW: FCC SAYS NO ON PRB-1 EXPANSION REQUEST

Ham radio has lost yet another battle against deed restrictions, but the war is not over yet. At least that’s what the ARRL appears to be saying in a bulletin that describes the latest skirmish with the FCC over this politically volatile issue.

In the latest round, the FCC has affirmed a November 2000 staff-level decision that declined to include privately imposed deed covenants, conditions and restrictions under the limited federal preemption known as PRB-1. That’s the federal government policy requires municipalities to ''reasonably accommodate'' amateur communication in antenna-related zoning and regulation.

The ARRL last year appealed to have the full FCC review the earlier denial. The Commission turned down the League's Application for Review December 18 in a Memorandum Opinion and Order released December 26. As a result, it now looks as if the ARRL will bypass any further dealings on this issue with the FCC and will look for congressional relief instead.

The FCC itself even hinted that Congressional action by the ham community might be a next logical step. Its memorandum, opinion and order of dismissal did note that if Congress were to see fit to enact a statutory directive mandating the expansion of the FCC’s reasonable accommodation policy that the Commission would expeditiously act to fulfill its obligation there under. Translated: If Congress tells the FCC to include deed restrictions under the provisions of PRB-1, it will be more than happy to do so. (ARRL)

**

HAM RADIO IN SPACE: PROJECT JJ - HE EAGLE HAS LANDED

AMSAT-NA's newest satellite project, known as Project JJ for the past year, now has a new and official name. This, as AMSAT North America President Robin Haighton, VE3FRH, announces that effective January 1, 2002, the satellite will officially be known as 'Eagle'.

The name Eagle was submitted by Bill Allen, W7US, of Tucson, Arizona. It was selected from a list of forty-five names submitted by twenty-nine satellite operators.

For his winning suggestion, W7US will receive a free dinner at the annual AMSAT dinner held during the Dayton Hamvention. We will have more ham radio space related news later on in this weeks Amateur Radio Newsline report. (AMSAT-NA, ANS)

**

BREAK 1

Welcoming in the new year with ham radio news coming to you from the United States of America. We are the Amateur Radio Newsline, heard on bulletin stations around the world, including the N7VGS repeater serving the Salt River Star Valley Wyoming and congratulating 13 year old Devin Cassity, on becoming the youngest ham in South West Wyoming. Devin is now KD7PHN.

**

EMERGENCY PREPAREDNESS: NORTHERN CAL TOWN CHOOSES HAM RADIO

Ham radio started the year with some very positive public exposure in the Los Angeles Times. The January 1st edition featured an in depth article about a Northern California town that will tap into older technology to prepare for future emergencies.

Worried that a disaster will knock out e-mail and cell phones, Los Altos Hills has decided to turn to its local ham radio community and make it the primary back-up to normal disaster preparedness communications. And as you might expect, the hams are more than ready to oblige

The complete story can be read at the Los Angeles Times website. The complex URL is http://www.latimes.com/news/local/la-000000203jan01.story. (Highlighted by ARNewsline™)

**

AMERICA AT WAR: POPCOMM COLUMNISTS SAYS “DONT TURN THE OTHER CHEEK”

Popular Communications writer Eric Force has some strong words that are obviously aimed at the pacifists who oppose the United States military retaliation against Osuma bin Laden and his al-Quida terrorist network. As a response to those he calls the “do-gooders of the world” who promote turning the other cheek, Force says to look, really look at the attack that brought down New York City’s World Trade Center twin towers. He then says that it could have struck a lot closer to them.

Force says and we quote: “Consider that it could have been you, your mom, dad, brother, sister other relative or a close friend in those planes and buildings who were terrorized, murdered and buried in the rubble.” He adds that just thinking about the incomprehensible terror, suffering and losses incurred by innocent human beings a the cowardly hands of international thugs continues to tear at his heart.

Force has dedicated his latest I-Waves column to the sights and sounds of September 11th that are available on the Internet and to the victims of the tragedy. Its a very compelling article. You can find it starting on page 66 of the January edition of Popular Communications Magazine that’s on newsstands right now. (PopComm)

**

AMERICA AT WAR: FEDS TO AID NYC TV STATION REBUILD

New York television stations will be getting federal help rebuilding transmitters that were destroyed in the September 11th terrorist attack on the World Trade Center. A total of ten New York area stations will receive eight point two million to offset the thirty million to forty million dollar price tag for purchasing and
constructing a new transmission facility.

According to the Broadcasting and Cable newsletter, Senator Charles Schumer managed to secure the funding as addition to emergency aid appropriation for victims of the attacks. As previously reported, there is some speculation that the replacement transmitting facility could be a 1500 to 2000 foot high stand-alone tower constructed near the former site of the Twin Towers. (Broadcasting & Cable)

**

ENFORCEMENT: NAL CANCELED

The FCC has canceled a proposed ten thousand dollar fine that it had issued to Jeffrey Alan Pettrey, This, for his apparent violation of Section 301 of the Communications Act involving operation of an unlicensed radio transmitter.

Back on July 30, 2001, the District Director of the Commission's Columbia, Maryland Field Office issued a Notice of Apparent Liability for Forfeiture in the amount of $10,000 to Pettrey for the infraction. Pettrey filed a response to the N-A-L on August 7, 2001 accompanied by documentation regarding his

inability to pay the proposed fine. After reviewing Pettrey's response, the FCC conclude that cancellation of the proposed $10,000 forfeiture is warranted based on Pettrey’s inability to pay. (FCC)

**

ENFORCEMENT: FCC CANCELS CONVICTED HAMS LICENSE

The FCC has canceled the Amateur license of Kenneth P. Kelly, WT2FBI, of Greensboro North Carolina after Kelly failed to show up for a re-examination. But at the time of the FCC retest order Kelly was otherwise occupied. He was fighting criminal charges in relation to a jamming case in Ohio. We have this report:

--
On November 30, 2001, Kenneth Kelly, the ex-WT2FBI was sentenced to 5 years probation by the Judge H. J. Bressler in a Butler County Ohio court. He had previously been indicted on a 4 th degree felony charge of disrupting public service by his jamming and talking on the Middletown Ohio police radio system.

At his hearing, Kelly agreed to a plea bargain. He admitted his guilt to a reduced charge attempted disrupting public services. At the time the FCC pulled his ham radio ticket Kelly was being held in the Butler County Ohio Jail pending sentencing.

By way of background, a person later proven to be Kelly was first noticed on the Middletown police radio channel the third week of July 2001. Initially the police dispatch radio system was not recording him but that was soon remedied by city radio technicians. After several days of taping, it was observed that the voice on the police radio was similar to one heard on the local 2 meter Amateur frequencies.

Several members of the Dial Radio Club then assisted police by monitoring and taping Kelly on the 2 meter band. Tapes from 2 meters and from the police were then voice printed the aid of computers to check similarities. Dial club members also tried to direction find and locate the signal both on 2 meters and on the police channel.

Through some luck, detectives working with a metro housing police officer and discovered that Kelly was now living in their jurisdiction. After they interviewed him, they felt that he was the person interfering. As the investigation progressed, he admitted to detectives that he may have accidentally transmitted on their frequency by accident. He claimed that his signal may have been mixing with an FM broadcast station and another ham repeater.

But Police did not believe it was accidental, because he was taped trying to talk directly to the police dispatcher and the cars. Later Kelly did admit his guilt and entered into the plea bargain. Now sentence has been passed by both the local court and the FCC.

For the Amateur Radio Newsline, I’m Burt Hicks, WB6MQV, reporting.

--

When he was finally caught Kelly had a Yaesu VX-5 hand held in his possession that had been modified to transmit out of band. The assistance of the Dial Radio Club members is credited with helping to solve this case.

Note: Information and documents from the case can be obtained from the Butler County Ohio Clerk's office or online at: http://www.butlercountyclerk.org/ Click on Butler County Court Records Search. Then enter Kenneth Kelly. (FCC, Dial ARC, others)

**

ENFORCEMENT: MITNICK TO FIGHT TO KEEP HIS HAM LICENSE

Another ham who appears to be getting ready to do battle with the FCC is former computer hacker turned talk show host Kevin David Mitnick, N6NHG. Amateur Radio Newsline’s Bill Pasternak, WA6ITF has the latest:

--

As reported last week, the FCC is challenging Kevin David Mitnick's request to renew his ham radio license. The agency claims that his criminal background raises a substantial and material question of fact as to whether Mitnick possesses the requisite character qualifications to be and remain a commission licensee.

Now, N6NHG has told the U-K Newspaper the Register: "It's just another example of them trying to harass me. Now I've got to spend money to keep a ham license."

Mitnick insists that he has totally abandoned his former ways. The Register article notes that that he was recently called to testify before Congress on federal computer security matters. Also that he spent two days briefing the U-S Commission on National Security on these issues. Mitnick tells the Register that he cannot understand why the government is now questioning his character.

Mitnick is currently the host of the radio program called The Dark Side of the Internet. It airs in the Los Angeles area from 5 to 7 a.m. Sunday mornings over radio station KFI 640 AM. And in a recent appearance on Coast to Coast A-M hosted by Art Bell, W6OBB, Mitnick said that he is hoping for a career in computer security once his term of supervised release from prison has been completed.

For the Amateur Radio Newsline, I’m Bill Pasternak, WA6ITF.

--

The complete Register story and interview with Mitnick is on the web at a rather long and complex U-R-L. You will find it at http://www.theregister.co.uk/content/55/23494.html (Adapted from the Register)

**

INTERNET SECURITY: CIA GOES OUT OF ENCRYPTION COMPANY FUNDING

And speaking of Internet security, word that a Central Intelligence Agency funded company that allowed Web surfers to browse anonymously has closed. According to news reports, Emeryville California based SafeWeb enabled Internet users to gain access to the World Wide Web and browse sites through its encrypted service. This made their on-line habits and history untraceable. In the 2000 - 2001 fiscal year, SafeWeb received one million dollars in funding from the U-S Central Intelligence Agency's venture capital arm. (published reports)

(5 sec pause here)

**

HAM RADIO BUSINESS: AMATEUR RADIO TRADER CEASES PUBLICATION

Ham radio Internet auction sites may be responsible for a twice a month ham radio equipment sales magazine going away. This, after Amateur Radio Trader magazine announces that it has ceased publication.

According to Editor Barbara Patterson, KF4MMV, the Amateur Radio Trader was no longer a viable product. She says that the firm will be redirecting its resources into other areas.

Meantime, the company has also pulled its amateuradiotrader.com website off line. But unlike other publications which have gone under, in this case subscribers are being reimbursed for any outstanding issues. In addition to handling buy and sell ads, Amateur Radio Trader also donated page space to advertising the annual Newsline Young Ham of the Year award. (ARNewsline™)

**

HAM RADIO HERITAGE: MAKING WCC A PART OF THE FUTURE

A ham is campaigning to preserve part of radios past and have it become a part of the future. This as Lewis Masson, K1LJ-S, says that the town of Chatham Massachusetts should convert the site of radio station WCC into an Amateur Radio station along with a training curriculum to teach the kids in the area about communications technology.

WCC is one of the original Marconi Marine Radio Stations. Masson is an ex-marine telex operator at WCC. The site was recently turned over to the town of Chatham and Masson believes it is important to preserve the operations building as an operating amateur radio station and keep the hotel building as a museum to preserve and display memorabilia.

Masson says over the Internet that he has formed a committee to work on this project and that they are looking for nationwide support for this campaign. If preserving the past as an investment in the future is of interest to you, please contact K1LJS by e-mail to lemasson@juno.com. (Internet)

SPECIAL EVENTS: HAM RADIO UNIVERSITY 2002

A reminder the third annual Ham Radio University event takes place on January 20, 2002. Location is the Babylon Long Island New York Town Hall Annex with the doors opening at 9 a-m Eastern time.

Ham Radio University is a day of education about Amateur Radio. This there will be twenty, one-hour presentations with special forums geared to the non-ham as well as the experienced Amateur Radio operator. The focus will be "hands on" with many demonstrations. Besides the forums, there will be tables set up with information about the different groups, ham radio classes, exam session schedules, public service and other activities.

For more information about Ham Radio University, please contact its Chairman Phil Lewis N2MUN by e-mail to n2mun@optonline.net. You can also get in touch with ARRL New York and Long Island Section Manager, George Tranos N2GA by e-mail to n2ga@arrl.org. Also check the Ham Radio University website for a full list of forums, directions and talk-in information. Its in cyberspace at www.arrlhudson.org/nli/hru2002.htm (N2DO)

HAM RADIO RECORDS: BEST OF THE WEST AND VHF CONTEST HONOR ROLLS

Tim Marek, K7XC, says that he has updated W6 / W7 & "Best In The West" VHF Contest Honor Rolls. They are now available at the following web sites.

http://k7xc.tripod.com/VHF_Records/index.html s the stand alone records page. http://k7xc.tripod.com/K7XCweaksignal/ is where individual links can be found to each contest. (VHF Reflector)

**

HAM RADIO SCIENCE: NEW 6 METER PROPAGATION BEACON IN WASHINGTON STATE

Rich Ewing, KO7N reports over the VHF Reflector that Bruce Shurtz, W7BAS, has installed a propagation beacon in gridsquare CN87TG near Kennmore Washington. It operates on 50.069 MHz putting out 10 watts to a 5 element yagi pointing 90 degrees. The beacon is operational 24 hours a day, seven days a week. QSN reports go to W7BAS, at his callbook address. (VHF Reflector)

**

HAM RADIO IN SPACE: VERY FEW LAUNCHES

Peter Guezlow, DB2OS, reported that 2001 has turned out to be the slowest year for space launches in nearly 40 years. Ham radio or otherwise. According to DB2OS, only 58 flights reached orbit, and there was one complete failure.

Guezlow says that historians note that we must look back to 1963 to find a year that produced fewer launches. He says that in 2000 there were 82 launches to orbit plus three failures. By contrast the most productive year was 1984 when 129 launches delivered payloads into orbit.

But there is at least one bright note. Russia successfully placed five satellites into orbit recently after launching them aboard a Zenit rocket. The cargo rocket, carrying three Russian, one Moroccan and one Pakistani satellite, took off from the Baikonur space center in Kazakhstan. (AMSAT, ANS)

**

HAM RADIO IN SPACE: NEW INDIA WEBSITE

The AMSAT-India website has been officially launched recently by the government of India and the Department of Space. VU2POP says that you can check it out by taking your browser over to www.amsatindia.org. (ANS)

**

CONTESTS: HUNTING LIONS ON THE AIR

The 31st annual Hunting Lions in the Air contest will take place on the weekend January 12th to the 13th. The contest period will be 48 hours and will run from midnight UTC Friday night to midnight UTC Sunday night, and all hams are welcome to participate.

According to its sponsors, the objective of this operating event is to create and foster a spirit of international understanding and cooperation among radio amateurs and members of the Lions Clubs through the use of world-wide radio communication. The contest also commemorates the birthday of Melvin Jones, the founder of the Association of Lions Clubs who was born at Ft. Thomas, Arizona on January 13, 1879. (Q-News)

**

DX

In DX, word that the recently postponed Ducie Island Dxpedition is on again for March. Ducie Island became a DXCC entity last November and it immediately jumped to the top of the most wanted contact list. But rough seas scuttle the first attempt to put it on the air. (RSGB)

Meantime 6 meters continues to be the V-H-F D-X band of choice. On Monday December 31st, Kevin Bishop WB8XX, says that he started hearing O-H-1-X-T at 1300 U-T-C on a backscatter path. From then on until 1620 U-T-C he worked 8 new countries and over thirty new grids in Europe and Asia. (VHF Reflector)

**

STRANGE TECHNOLOGY: ARE CELLPHONES KILLING GHOSTS?

Now, from radio communications to the effect of radio communications on supernatural communications. This, as a British expert who has spent years researching the occult says that cellular and other mobile phones are killing off ghosts. Don Wilbanks KC5MFA has the details:

--

No, we are not kidding you. In fact, Tony Cornell, of the Society for Psychical Research, has told the London Sunday Express that reports of ghost

sightings started to decline when mobile phones were introduced 15 years ago.

According to Cornell, ghost sightings had remained consistent for centuries. In fact, until three years ago the society received one or two new ghost sighting reports every week. But with the introduction of mobile phones 15 years ago, ghost sightings began to decline to the point where they are not receiving any.

And why are there no longer any ghosts being observed? Apparently paranormal events, which many scientists attribute to unusual electrical activity, my be drowned out by the electronic noise produced by cellular telephones and text messaging pager transmitters. And according to the newspaper, the lack of ghost sightings could adversely impact on the nations economy. It says that haunted tourist attractions in Britain could be under threat if the number of cellphones continues to grow from the present figure of about 39 million now in use in the U-K.

Don Wilbanks, KC5MFA.

--

And all of this begs that one question be asked. If ghosts are the spirits of the dead, how can anything actually kill them? (Science Today)

The 4-1000 is the vacuum tube. And EME typically requires only 500W at 2M and
250W at 23cM and antenna gain in the 20dBi and 30dBi respectively.

I've just built a Vectronix 80M QRP transmitter. I'm hooked.

What other QRP kits exists? What are some of the pros and cons for them?
Overall, is there a single QRP Kit that is the best of the best?

Thanks,
KG4QJM

You might consider kits provided by Norcal (Northern CA QRP Club).
Wilderness Radio sells commercial versions of these kits. Also,
the DSW series QRP radios have an excellent reputation.

BRASSO metal polish works *very* well on plastic. It is a very mild abrasive, polishes to a glass-smooth finish. Doesn't require a heavy touch--just light circular polishing with a cotton cloth.

I'm looking for a repeater for FRS-band radios. Is one available? If not, would it be possible to construct one? I'm not adverse to electronic work, by the way. ;) Thanks for any information!

Andrew H.

(Sorry about cross-posting, but I wasn't sure which group to post to.)

129. Passive LC filter design

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-07 04:39:30 UTC
From: "Clyde R. Shappee" <cshappee@ieee.org>
Message-ID: <3C392682.78CA8E3C@ieee.org>
Source record: 47571

I am working through the math involved in Passive LC filter design.

I have books that give tables of component values on how to do this, all normalized to 1Hz. I am fine with that. All the tables are for designs with no Zeros in the transfer function; they are "All Pole" designs.

In my text on microwave circuit design, it talks about filter synthesis and the designs have Zeros in the transfer function. Obviously, this means that the filter has a capacitor on its input.

What is the real difference? Why should I care? How do I use the methods in the microwave book to synthesize a filter that is all pole?

Any help or direction to literature would be greatly appreciated.

Clyde

133. Re: Passive LC filter design

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-07 08:32:33 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <3C395D21.B6A9F362@eznec.com>
Source record: 47575

A zero in the transfer function means that there's a frequency at which the response of the filter has zero transmission. All pole filters don't have this property. The design of a filter is a world of tradeoffs among simplicity, sensitivity to component variation, loss when realized with real components, cutoff sharpness, passband and stopband ripple and phase response. In the time domain, some of these combine to determine rise time, overshoot, and settling time. Realization is also a consideration; it's often not possible to obtain real components with the values required by some designs. In filters I've designed, unavoidable parasitics have often been a major consideration, and I've had to use transformation techniques to come up with a topology that would allow me to absorb the parasitics into the filter circuit. Filter design is very much an art as well as a discipline in itself. Choosing whether to use a filter with zeros frequently requires considering a number of tradeoffs.

In general, filters with zeros have more passband ripple and more rapid phase change, hence poorer time response, than ones without. But they're very useful if specific frequencies (such as harmonics) need to be attenuated a great deal, since the zeros can often be placed at or near the frequencies where large attenuation is needed.

Nearly all filter synthesis books I've seen are either pretty general and theoretical (such as Van Valkenburg's _Introduction to Modern Network Synthesis_) or tend to concentrate on one class of problem. I haven't kept up to date, but some time ago a book by Zverev (sorry, I never got a copy and don't recall the name) was widely regarded to be the most useful for practical design, but I don't know how deeply it went into the theory. Computer programs have surely replaced the extensive design tables in that book.

I purchased the following with the Intention of Building up
a second large HF Amplifier !
The Project has been cancelled, and therefore offered
to the serious Builder !

New in Eimac Box YC-243=3CX6000A7 Triode
New 80amp/240v Peter Dahl Fil. Tranny
New Chimney
New Peter Dahl Filament Chokes
Complete Package Price=$1200.00
The tube alone retails for this Price !
Buy the TUBE and the rest is free!

* The nice thing about this New Tube is the Mounting aspect!
No Socket is required , the Grounded + Grid ring , is
the "Flange mount" and the Chimney fits over the Tube
Its that Simple !

NOTE* I will split the shipping etc.!

There are many(several) gmrs repeaters around the country. Do you want to put up a simplex repeater (records then repeats the signal normally on the same frequency) or a duplex repeater (simultaneous recieve and transmit on a different frequency)?

Each type of repeater is possible using gmrs radios (same frequencies as frs), it just won't be cheap to put up a tower, antenna, radios, repeater controller etc.

The few gmrs repeaters I have heard about were subscription only. You had to pay to use them. Not something for the casual frs user.

Anyone who can put up a 440 repeater could do the same for gmrs/frs, it would use similar antennas and feed line.
thanks, John.

Anyone got plans/partlists/schematics for something to pull in _only_ 2.5, 5, 10, 15, and 20 MHz. -- maybe all five at once, for frequency diversity? Or do I get to design and build it myself? I followed a link to AADE.COM (Almost All Digital Electronics) from the Google search results, but came up dry.

Hey - Ryan

The QRP Amateur Radio Club International:

http://www.qrparci.org

has a fairly extensive list of links for kit suppliers. Unfortunately, many of the more fun kits (unusual, low priced, etc.) tend to be produced by clubs (NorCal, NoGa, NJQRP, Flying Pigs) and only for a short time. If you aren't in touch with what's happening when it happens, you can miss the opportunity.

The QRP-L reflector does give you a chance to keep up with a lot of what's going on, and is a good way to get feedback on QRP kits. But it is a very high-volume list, so you better know how to work your inbox rules! Subscription information and archives at:

http://qrp.lehigh.edu/lists/qrp-l/

A somewhat less intense (and consequently less useful) forum is the QRP-F:

(http://www.e-discounter.net/qrparci/).

Ten-Tec has some VHF kits, but the prices are higher than already built commercial rigs with more features. VHF kits seem to be few and far between

..

Hi Andrew,

FRS is a special class of service where only very low power direct communication is possible as designed. The typical cheap'o frs radio will not do repeater frequency splits.

It is possible and quite common to put a voice recorder/playback unit on a simplex (non repeater) frs radio. It will record what every it hears, then play it right back after the transmission is over. That type of circuit and its operation is often refered to as repeater. In true repeater lingo, it's only a voice record playback unit. More of a toy than anything else.

Right next to the "splinter channel" frs frequencies are the original UHF GMRS and business band frequencies where both simplex and duplex (repeater) operation is legal. If you wanted to use a UHF band Repeater, you would put up your own or rent time on one. That's kind of what I do out here in Northern California (Sacramento, Northern SF Bay Area). Its very cheap to rent use of a GMRS Repeater.
By design, you are not really supposed to do business on GMRS, but again... you can use a business license on a proper frequency right next to it to get your work done.

On the Mountain Tops I deal with, we have combinations of business and gmrs repeaters. Most of the newer common radios do both. The thought is to talk to your business on the proper channel, then change to your home gmrs "family" channel and call home/other people for non business needs.

Radios are blowing out of the stores that do all kinds of services. You could by a good UHF radio and use it for all the services. Power Output on the frs band would have to be reduced to the very low limit, but most of the newer radios can program the proper changes right in.

FRS is for close in work and play (real world is about 1 mile range on level ground).

Business and GMRS repeaters can extend your range for an easy 120 mile (or more) diameter circle (of the repeater location) in good locations.

Hope that helps...

cheers

Oh, I see. I could try and give a smart arse response and say:

1. What is a tube?
2. We gave up VALVES in the 'old country' years ago.

But the truth would be that I didn't recognise the part number!

FRS doesn't allow repeaters.

The full-blown GMRS does.

I'll have to try that sometime just for kicks. It would be very easy
for me to try as I already have a preamp set up for icom , and I can
plug any element into the base with a 1/8 inch jack. I also could try
it on a 830. I don't know about 8-10 inch speakers, but I might try a
4-5 incher just to see what it does. The best mike I've found so far
is an old audio technica dynamic I got free in a junk pile.
As far as normal mikes at a decent price anyway. I think $ for $, a
semi cheap dynamic studio mike is about the best deal for the dollar.
You can buy shure versions at rat shack for 20-40-60+ bucks. I think
MARS and most the other music stores have audio technica and other
brands. Compared to spending nearly 200 bucks for a factory electret
desk mike that are typical these days, they are a much better deal.
Sound better too. You do have to rig a PTT and base though. I just
mount it on an old junk base. My A/T mike is mounted on an old turner
plus three base. That way I get the lock down PTT. MK

I don't have any info on it. I have one, but gutted it out ages ago
and just use the base. All you need to do to get the vox going is jump
the element hot wire so it's not controlled by the PTT switch. Jump it
so it's hot all the time. MK

No source for schematics [sorry!], but if all you need is a working receiver you might haunt second-hand shops or search eBay for an old Radio Shack "TimeCube" receiver. About 4" on a side, telescopic antenna, and push-buttons for (IIRC) 5, 10 and 15Mhz crystal controlled, runs on a 9v transistor radio battery.

Fellow hams:

Okay! Now that I got your attention, I bought for $40 a bunch of PC power supplies, and I am curious about how I can combine them into one supply!

They have a 25amp 5V output on each one, and an 8amp 12V output on each one.

I am curious to know what or how I can:

(a) combine the 5V outputs from 3 supplies to yield me a combined 25amp 15V source (presuming three are powered up at once)?

(b) take 3 8amp 12V outputs and merge them into a single 24amp 12V output

I have PC supplies out the a$$, and wish to combine them to build a massive 200amp supply, any ideas how to do this? I long ago forgot my electronics theory with regard to power supplies, and I think you need diodes or something to keep the electricity from flowing from one supply to the other.

Stuart

>

Actually, the GMRS frequencies that permit repeater operations are different from FRS frequencies. Actual repeaters (simultaneous re-transmission of the input on a different output frequency) are not allowed on FRS. Store and forward may be (that is a separate debate in itself).

GMRS and FRS share 7 frequencies. No repeater operations are allowed on those 7 frequencies.

As to cost, if you go buy new equipment and pay someone to do the work (like tower climbing and antenna installation), you can probably put up a repeater for somewhere between $5,000 and $10,000. Then you have recurring site rent, insurance, etc. If you are on a regular commercial site, expect to pay anywhere from $500 to $1000 a month rent.

Carl.

I don't know about MFJ, but Hamtronics, http://www.hamtronics.com
has a WWV receiver. I remember seeing a review in 73, and it actually
seemed quite fancy.

You used to see all kinds of dedicated WWV receivers described in
the ham magazines. Usually, they took the form of a converter ahead
of an AM BCB radio. A car radio has the advantage that it's shielded
and has an antenna jack for feeding a converter into. If one can't
find such a specific article, it's just a matter of finding a converter
schematic that covers the general range, and getting a crystal that
would converte the WWV frequency down to the IF.

Of course, people did build complete WWV receivers, but since they
all seemed to use 455KHz IF's, one might as well start with a broadcast
receiver. I've seen one or two that started with one, and moved it
to 2.5MHz, is WWV still on that frequency?, and then a converter to
get the other frequencies.

One design that I liked from Ham Radio, was a TRF design, with
a single-crystal filter after a stage of RF amplification, feeding
some more amplification and a diode detector. Considering the
availability of 10MHz crystals, I am tempted to try a ladder filter
on 10MHz, and then some stages of amplification.

Sorry for any confusion; this is basically what I have in mind:

I live on top of a hill which overlooks most of the town. I can get a good signal to and from someone down in the town, but actually being in the city greatly reduces the range (as one might expect). What I'd like to do is set up something at my house that acts like a satalite of sorts; any communications on one specific frequency (channel 12 or something like that on the FRS) would get rebroadcast. This would allow other people to take advantage of this if they so desired (by using the broadcast channel). I wouldn't want any kind of power increase; this is just to solve some LOS issues. :)

Again, I'm not trying to increase the range, I'm looking to create a reflector of sorts. (The same end result as having someone stay at my house and relay messages from one person in the city to the other). ;) Any ideas?

Source record: 47502

It's been a long time since I dug into filter synthesis at this level, so I hope someone more up to date will jump in and set the record straight if I don't recall the details correctly.

A zero in the transfer function doesn't necessarily mean that the transfer function will go completely to zero at any (real) frequency. Similarly, a pole doesn't mean that the transfer function will become infinite. The relative amplitude response of a network at a given frequency is equal to the product of the vector distances from the point on the transfer function imaginary axis representing that frequency to all the zeros, divided by the product of the vector distances to all the poles from that same point on the imaginary axis(*). So the magnitude of the transfer function will go to zero at a particular frequency only if a zero lies on the imaginary axis at that frequency. If the zero is off the axis, the response will take a dip at or near the imaginary part of the zero's complex frequency, but won't go to zero. Similarly, the response would get infinite only if there were a pole on the imaginary axis. What I can't recall is whether an imaginary axis pole (actually, pole pair) can occur in a theoretically lossless network. If it could, the transfer function would become infinite at the frequency in question. If not, it can get arbitrarily close, resulting in an arbitrarily large transfer function response. In both theoretical and real filters, the (voltage or current) transfer function can, and frequently does, exceed unity at some frequencies. When source and load terminations are considered, though, conservation of energy always has to rule.

In the common lowpass and highpass filters I've seen which have transfer function zeros, the zeros are generally on the imaginary axis, resulting in a zero amplitude response at some frequencies. Allpass filters (ones with flat frequency but variable phase response), however, generally have complex zeros (that is, zeros which aren't on the real or imaginary axis). Other specialized types, such as equalizing filters, also often have complex zeros.

Pure theoretical LC filters have no loss anyway, so the location of poles and zeros has nothing to do with determining the filter loss. Attenuation is due purely to "mismatch loss", that is to say impedance mismatch. When a filter does have loss due to resistive components, the locations of the poles are limited to some distance from the imaginary axis depending on the loss. It's possible that by "loss" you meant "attenuation" (or "mismatch loss"). In non-matched filters, the output voltage or current can exceed the input voltage by a large factor, even when the poles are complex, as I mentioned above.

As I said before, filter design is a discipline in itself.

Roy Lewallen, W7EL

(*) If there are no zeros, use the value 1 in place of the product of zeros. The phase response is the sum of the angles of the vectors to all the zeros minus the sum of angles of the vectors to all the poles. It's easy to see from this that if poles or zeros are close to the imaginary axis (i.e., have high Q), the amplitude response changes rapidly, but so does the phase. A zero on the axis causes very rapid amplitude and phase changes with frequency.

First its not legal to set up a repeater on FRS. From a technical standpoint It will be rather difficult to do using standard FRS equipment. One problem is that the repeater will be receiving and transmitting simultaniously in the same band. The closer the two frequencies the more difficult it will be to keep the transmitter from desensing the receiver. Amateur repeaters generally use a 600 Khz separation and then need special tuned cavities to make it work (although they are usually running a lot more transmit power than FRS). Another issue is that your user's FRS radios must be capable of transmitting on one frequency and receiving on the other. I've not seen an FRS radio with this capability.

Another option is a "simplex repeater". You transmit a message, the repeater records it. When you unkey, the repeater echos your message on the same frequency. It's slow, but could use standard FRS radios.

I'm just curious: is it correct to assume that the current AM broadcast band is really the best choice of frequency for the desired characteristics for that service? In other words, was 540-1600 kHz (before expansion to 'AM wide' a few years ago) chosen first, and then the stations placed there? Or did the stations begin operation in that frequency band and just happened to choose a good ground wave frequency band for local broadcasting?

I've been reading some of the history of KDKA, which of course was the first commercial broadcast station in Pittsburgh in 1920 (on 360 meters, according to the original FCC license), and it seems that the Westinghouse engineers knew that starting around 1500 kHz ground losses increased, making those frequencies less useful for local reception. (They apparently didn't know about sky wave propagation). But aside from that, is there anything magical about the current broadcast band that makes it the best choice?

Thanks,

Al W6LX

You are quite correct about needing to isolate the supplies outputs from one another. This is especially important with switchers. Another problem or two that you are likely to have, depending on the design of any particular supply, is that a) some supplies don't even put out a voltage unless there is a load applied when they first power up and b) most computer power supplies put out 12V plus or minus 1%.. and are not adjustable, so you are already under voltage for your 13.8V rigs.. and then you put in the isolation diodes and drop it to ~11.4V. Seriesing the 5V supplies for 15V would be trickier still because of the differing load regulations for the different supplies..

I just saw a product in the office supply store that I've never seen before - Inkjet decal sheets. They are made by Avery (maybe others make something similar). I was in a hurry, so I didn't look the package over very closely, but this product might have promise for DIY chassis markings.

I've had very good results using "water slide" decal sheets from the hobby store, but you have to use a color copier to put the image on them - inkjet directly on them just doesn't work.

I couldn't tell if they are adheasive backed or water slide, but I'm going to get some soon and try them out. Have any of you tried these?

Hmm, most people assume FS means For Sale....

Well, now for the answer you're not wanting to hear, it'll be nearly impossible to combine them into a massive output supply. The biggest problem you run into is how to get the voltage regulation to synchronize between them all (none will be at the same voltage, so some will carry more of the load than others, then those will over-current and shutdown or fry, allowing the next ones to do the same shortly thereafter). This is a big problem for high reliability systems with multiple supplies, they use all sorts of fancy current sharing schemes.

First off, you need to isolate all the outputs from each other with diodes so the lower voltage ones don't suck current from the higher ones trying to get the voltage down to what they think it should be (the higher ones will boost their output to compensate for the "load"). But, you still have the problem with the higher voltage ones taking tall the load. Without serious modifications to the voltage regulation circuits, it just won't work...

The ear has big problems understanding voice with zero crossing clipping/distortion, but it has little problems with peak clipping, (some audio processing/peek clipping will improve the range of a ham transmitter.) Most people can understand voice with 20 db peak clipping, but 3 db of zero crossing clipping eliminates all understanding.
The diode is a good AM speech detector as it it matches the ear's capability. If the application is not speech, then it may or may not be good.

=========
Andrew , I very much doubt your 'repeater' would be legal. I do know that
FRS radios have a fixed antenna and are type approved.
This means home-brewing anything for use on FRS frequencies (around 451 MHz
?) is highly likely illegal.
Here in the UK we have a similar service (Personal Mobile Radio)PMR 446 e.g.
8 channels 12.5kHz spaced commencing at 446.0025 MHz .Same recipe : type
approved ,fixed rubber duck antenna ,no home brew mods permitted.
(the 70cms amateur band in ITU region 1 is only from 430 - 440 MHz).

Hi,

I'm interested in adding a circuit to a single 3-500 amp that will gradually allow more current to the plate transformer to avoid the impressive current spike at power ON.

I've seen circuitry with time delay relays that short out a series resistor in the AC line after 10-20 sec. but wonder about using an NTC resistor instead?

Am I off track in thinking that a series R that started at say 10 ohms and then went to about 0.5 ohm when hot would do the trick?

Thanks,

John VE3PCN

Well, then.... If your intended, 'extended' operation is in one
general direction: Try placing the FRS which you use at home in
some sort of a corner or parabolic reflector -- pointed, of course,
at the town. Using shielded cables run mic input and audio output
lines (and a suitable pwr line) from the now fixed-placed FRS radio
(mounted in the reflector) into the house. Mount it out-of-doors
with no line-of-sight obstructions.

It's an 'experiment' I've often thought to try.

"Weatherproofing, construction, focus, cabling, and powering are
left as an exercise for the student."

The surge lasts only for the first cycle of the AC supply, about 15 or 20
milliseconds. You probably don't need a resistor. A very small inductance
may be all that's necessary.

How do you know you need anything at all ? If it works don't fix it.

I could have sworn that CHU was on 7,333.3333333333 because a few
years back I saw a reference to 7335KHz and thought that couldn't
be right. Yet, checking the 1972 ARRL Handbook, I was licensed
that year, it is indeed 7335KHz.

So I suspect there is some reason, an error at one point or just
an assumption, that CHU would have that repeating decimal. Face it,
the CHU frequencies are odd-ball compared to WWV/WWVH, so there
is less reason to remember the exact frequency in the first place.
And the repeating decimal does seem to make more sense, since multiplying
it by three gives you an even MHz, 22Mhz to be exact. Except, there
is no CHU frequency there, so it can't be explained by one standard
for all the frequencies.

There seems no immediate rhyme or reason for the frequencies used
by CHU. I know the range they are in, but I think I'd always have
to look them up to give the exact frequency. The only thing
that does stand out is that they are all close to a ham band, within
120Khz, though that seems an unlikely reason for the choices.

Most Commercial and Ham amplifiers/transmitters of good design now use soft start circuits. A resistor is most commonly used. The transformer primary is ALREADY inductive..... Why add more? 73 Sparks W4EAS

182. Re: at what point will a germanium detector 'detect'?

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-08 20:02:46 UTC
From: "Richard F. Gillette P.E." <r.f.gillette@ieee.org>
Message-ID: <3C3B4F68.DE6D22A2@ieee.org>
Source record: 47522

Draw a sine wave, say 4 inches peak to peak. For peak clipping just clip the top and bottom so the resulting almost square wave is 0.4 inches peak to peak. For zero crossing clipping fold the paper so that the part of the wave near zero is eliminated and the peak to peak height is about 2.8 inches. Now change the sine wave above (a pure tone) to voice wave form. Reducing the peak to peak amplitude from 4 to .4 by peak clipping and and we still understand, but reducing it from 4 to 2.8 by zero crossing clipping and we will not understand.

The point I tried to make was, the diode detector has little distortion at low levels (near zero crossings) it has increasing distortion as the level increases. We can understand diode detected AM without a problem as our ears care about zero crossing distortion much more than distortion at the peak of a wave form. When it is important to have low distortion to understand voice the diode detector has low distortion, when the diode distorts our ears do not care.

He knows from the agonized "thump" that comes from the mains transformer at switch-on, especially if he happens to hit it at the wrong part of the mains cycle. He knows from the arc he can hear inside the mains switch, and wonders how long that switch will last. He guesses that equally unpleasant things are happening to the B+ rectifier diodes and the stack of electrolytics. He may also have heard of the tube manufacturer's recommendation to avoid forcing a large current into the cold, low-resistance filament of a 3-500Z.

Apart from that, it doesn't need fixing at all.

In a power supply of this size, it takes several mains cycles for the capacitors to charge up through the series resistances of the transformer and the rectifiers... but certainly not as long as 10-20 seconds.

There are various circuits around for a step-start which places a resistor in series with the mains for about 1 second, and then operates a relay to short it out. (The objection to the NTC resistor is that it leaves a residual resistance in circuit, which still depends on the current demand. Because the current demand for an SSB/CW power amplifier varies widely, the NTC resistor will affect the regulation of all the different supply voltages drawn from that transformer. Also the resistor needs to run very hot.)

If the mains transformer provides all the operating voltages - B+, filament and rectified DC for relays etc - then a step-start is very easy. The DC relay voltage will not rise to its correct value (usually 12-24V) until the B+ electrolytics have also been fully charged, so you simply connect the step-start relay across the existing relay supply. This provides a suitable delay, which can be altered by changing the value of the resistor(s) in series with the mains. There is a schematic at http://www.vcnet.com/measures/

If the filament and relay voltages are supplied by a separate much smaller transformer, that step-start idea won't work, so you'd have to use one of the other circuits.

|Sure. Works fine. Until the first time you have a momentary power outage and
|it comes right back on within a few seconds.

This is a good point. One trick to overcome the cool-down problem is a relay to short out the thermistor after the surge. But if you do this, you don't need the thermistor, an ordinary resistor will do <g>.

Good info at:

Unless ,of course ,you use a latching relay /push button in the 117 or
234V -AC Power supply , which I thought is normal for any power amp. A power
outage should result in an AC trip requiring a manual reset, a normal and
essential safety procedure for HV equipment.

The surge might have a number of causes. If the rig is turned off at an input voltage peak, the transformer iron can be left fully magnetized in one direction. If the voltage happens to be at the other maximum the next time it's turned on, core saturation can occur for the first cycle. This is probably the cause if you see a surge that's sometimes worse than others, and one that lasts only a cycle or two. A capacitive input power supply filter can draw a lot of current for the first few cycles as the capacitors charge up, another cause of a surge. There's another surge when filaments are turned on due to their low resistance when cold. I believe the original poster was concerned with a surge only when the high voltage was applied, so it wouldn't be the filaments in this case.

From the websites, and all agree...

Three frequencies are used: 3330, 7335, and 14 670 kHz. The transmission mode, upper single sideband with carrier re-inserted, provides time signal service without requiring a special SSB radio, and also provides three standard frequencies. The frequencies are derived from one of a trio of closely synchronized atomic clocks located at the transmitter site. Three clocks are employed to permit majority logic checking. CHU time signals are also derived from these clocks. The clocks at the CHU transmitter site, about 20 km from NRC's time laboratory, are compared daily with the NRC primary cesium clocks.

TO WHOM IT MAY CONCERN:

I posted messages in several newsgroups last month in reference to a Jordan Arndt, VE2SWL, of Calgary, AB, Canada, concerning his failure to ship items which I had paid for. In spite of my filing mail and wire fraud charges against Mr. Arndt, I told him that I would place an information bulletin in the newsgroups retracting the statements I made if I ever received my merchandise.

Mr. Arndt has been kind enough to allow me to pay for shipping a second time via Federal Express, and he allowed FedEx to come by his home at my expense to retrieve my merchandise and bring it to me. It arrived about a week ago, and was exactly what I had purchased.

I had originally paid for the items around October 15th, and it just took my paying shipping a second time, many threatening letters, and two and a half months for my goods to arrive. But Mr. Arndt DID finally come through on my items, so I can't fault him on the items. The items I ordered WERE in the box, and they WERE in good condition.

So, instead of stealing my money for goods, it appears that he actually only stole my money for shipping. I apologize to Mr. Arndt for accusing him of stealing something he didn't steal.

Mr. Arndt was nice enough to explain that he had been undergoing financial difficulties and that he needed to redirect all the money I sent him for goods and shipping to pay his rent, buy food, etc. and as a result, no longer had the funds I sent him to pay for shipment of my items.

Mr. Arndt, if you are reading this, I apologize for accusing you of stealing -ALL- of my money. I now know you only intended to steal -PART- of it. Please excuse me for placing false information prior bulletin concerning your theft. I take back every last word.

Thank you all for taking the time to read this,

Webster D. Williams, KR4WM in Myrtle Beach, SC

Hello all,

I would like to build a 1 tube 10Mhz Transmitter. Anyone have designs, plans, Schematics, Ect.. for one with parts not to hard to get, something simple, xtal controled?

Thanks

Jim - KU4QW

> band for local broadcasting?

I think the latter is closer to the explanation. Actually in the
earliest days it wasn't a 'band' in that context. 360 meters was the
norm for nearly ALL broadcast stations in June 1922 for instance. By
the following year they began spreading out but even still only a scant
few dared go above 1300 kc.

All the while in the early 20s there was an ongoing battle between
amateurs (many of which evolved into broadcasters) and commercial
stations. Hamming for ham-sake scuttled off above 200 meters as their
operating became a pest for broadcast listeners.
Here is an excellent page from an excellent site detailing the creation
of the broadcast band.
http://www.ipass.net/~whitetho/buildbcb.htm
Here's another good page

The old Radio Amateur Handbooks had one using a 6DQ6B, but that type of power oscillator is not really that good as the xtal is almost shaken right out of the socket with xtal drive current. You end up with a nice chirpy sound which is fine if you aren't trying to communicate via A1. You do get a lot of QSL's from the OO's, however. :-) I would advise a multi section tube with an oscillator and a final, both of which aren't pushed to the limit in power. Maybe a triode oscillator and a pentode final running less than 5 watts in. I don't have recommendations exactly handy, but I could probably figure something out eventually. There should be others out there that have a ready circuit. Watsa?

Andrew
Radio Shack made a simplex repeater that would just plug into the mic
and phone jacks of most handheld radios. This repeater would listen and
record then it would retransmit what it recorded on the same frequency.
They no longer sell this but there are still lots of them around for
about $75.

What power level are you striving for? Also, as another poster noted
the higher power single stage rigs are rough on crystal current and you
will have to use FT243 or larger crystal sizes for that class of TX.

FRS power limitations might make this impractical, but if I understand correctly what you're trying to do is to have signals from the town repeated back to the town, perhaps you could experiment with a passive repeater.

Passive repeaters can be anything from a simple dipole cut to frequency, two beams back to back, or a sheet of metal that will reflect the signal like a mirror. The latter have been widely used, and still are, to bend signals over and around mountains. Different configurations of passive repeaters are used to get cellphone signals out of buildings that would otherwise attenuate the signals severely.

I don't know what your neighbors would say to a big sheet of metal on your roof, but it might be fun to play with.

Yo Web...

I'm after Dave Munroe (or whatever he calls himself these days).... In Keene, Ontario, Canada.
Pay double ??? For what you agreed to??? Is Canada the breeding ground for the new internet rip-off artists?? Perhaps, but I wont stand for it. The individual I dealt with, dishman@northshells.net, swl@northshells.net, speedy@northshells.net have one thing in common.... northshells.net... and they have been put on notice. I've taken my case to the FBI and US Postal Service and have hired an investigator in Ontario to nail this guy. I've had many honorable dealings on the net but as of late our dear, loving, neighbors, up north, are more than willing to rip us off. Re-directing of monies ????? Good Lord !!! Is this the new welfare ???? Internet fraud to pay the bills ??? Lock and Load !!!! Let's shut these suckers down !!!!!!! Call the FBI...They are on the net.... Contact the Postal Service !!!! Argh !! Yer breakin my friggin nuts here.... Pay double... It would be cheaper if a bunch of us "Canuc trustin but got ripped off types" would take a bus up north with some Louisvilles and do some serious research . (If you know what I mean.) These "A" holes believe the US-Canada boarder affords them some protection.
Yo !!! Canada !!! I'm declarin' war !!! Thieving rodents !!! Yer goin down !!!!
NUKE CANADA !!! The new welfare state !!!!

Oscillator technology was a limiting factor in the early 1920s.
There is a great book called, "200 Meters and Down"
(available from the ARRL and elsewhere) that is a good
read with lots of interesting history. Check it out!

Source record: 47458

Clyde:

As several postings to this thread have noted, filter design, even "passive LC" filter design is an extensive field and it can occupy from at least a couple of years up to a lifetime to "master" the art. Given a very thorough EE level background.

A microwave textbook however is probably not the best place to start!

IMHO... filter design is one of the most rewarding engineering design methodologies to study since it encompasses all aspects of engineering design, from deep mathematical theory to practical implementation issues all in an elegant framework spanning the complete range of design issues from requirements and specifications on up to implementation, practical construction and manufacturability.

That said, and since... most cannot dedicate a lifetime to study this art and need immediate design solutions, you will find that for "most" applications encountered by the vast majority of basic design problems, there are readily available a number of "cookbooks" from which standard designs can be easily extracted.

In particular for the simple "all-pole" designs, there are extensive tabulations of LC values available.

In fact, for some particular well known all-pole approximations (e.g. Butterworth - a.k.a maximally flat, and, Chebychev - a.k.a. equiripple) there are several elegant but extremely simple explicit closed form formulae for the element values of the corresponding LC ladder filters. The theory behind these beautiful formulae is very deep, and their derivation involves mathematics beyond the ken of most graduate engineers, but the formulae are *VERY* simple.

I'll post some references here below which include something on the explicit formulae plus a lot of standard cookbook tabulations:

The so-called all-pole passive LC designs are relatively simple. They, have no finite, non-zero transmission zeros. All of their branches or arms are simple L or C elements in the low pass case. All of the transmission zeros, or "loss-poles" as the guru's call them, of all-pole low pass filters occur at

infinite frequency.

Here is the *amazingly* simple formula, due to Bennett, for the the values of the elements of the matched
Butterworth low pass filter. Your average pocket calculator can generate the values for very high order filters in but
a few moments, if you have a steady hand!

Ta da....

Am = 2*sin((2m-1)*Pi/2*N)

Where N is the "order" of the filter (i.e. the total number of L's and C's), and...m are the element numbers from 1 to N,
with Pi = 3.1416... according to the ancient Greeks, and sin being the sine function, with Am being the value of the
element (L in Hy for m odd and for, C in Fd for m even). Of course this is a normalized Butterworth filter with passband
cutoff at w =1 (Omega = 1 rad/sec)and termination impedances of 1 Ohm, and so the values would have to be
de-normalized as usual .

There are several other similar simple formulae for Chebychev and other filters...

I am always amazed that these simple formulae for passive LC filter design are not more widely known and used...
... too easy I guess!

More advanced designs with finite, non-zero transmission zeros, which offer much higher stopband supression than
all-poles, are often called Elliptic function, Cauer parameter, or Darlington parameter, filters. The name Elliptic
comes from the fact that the Elliptic Integrals are used in the approximation stage of the development of such filters.
The Elliptic functions are sort of like the trigonometric functions. That is they are periodic like the sinusoids, but have
the amazing property that they are periodic in two dimensions, not just one! Hence they can be used to generate
funtions/curves with equirpple behavior in two bands. The passband and the stopband! BTW... Cauer was a
German engineer and Darlington was an American engineer who simultaneously but separately developed the theory
for the Elliptic function filters.

If you are interestd in pursuing this filed, it is well worth the effort in terms of it's intellectual rewards, however, it's
not a study that will pay millions $$$ for your extensive study efforts.

Study filter design for the love of it! Heh, heh. Otherwise use the cookbooks!

I'd copy the pages on explicit formulae from Weingerg referenced below if I wanted the best pasive LC cookbook.
With those few formulae on a page or two, and a modern pocket calculator you can easilybvbe a "passive LC filter
guru" and amaze all of your friends...

Here's some key references, culled from my own library on passive LC filter design, to get you started:

The classic on the whole design methodology is:

1. Rudy Saal, and E. Ulbrich, "On the Design of Filters by Synthesis", IRE Trans., Vol CT-5, pp. 284-327, Dec. 1958.

A neat round up of the most amazing history of this field by one of the "greats" is:

2. Anatoly I. Zverev, "The Golden Anniversary of Electric Wave Filters", IEEE Spectrum, Vol. 3, pp. 129 - 131, March 1966.

Zverev also has published an extensive tabulation of filters by their element values:

3. Anatoly I. Zverev, "Handbook of Filter Synthesis", John Wiley, New York, 1967.

For an extensive tabulation of all kinds of filters by their mathematical parameters, poles and zeros, see:

4. Erich Christian and Egon Eisenmann, "Filter Design Tables and Graphs", John Wiley, New York, 1988.
(Find it in your nearest technical library on the shelves at TK7872.F5C5)

For many simple explicit formulae of LC ladder filters, and some background on their derivation see Weinberg, pp. 651-659,
there is *amazing* stuff in there, write down those formulae and keep them in your shirt pocket!!! :

5. Louis Weinberg, "Network Analysis and Synthesis", McGraw-Hill, 1962.
(Find it in your nearest technical library shelved at call number TK3226.W395)

Weinberg also has plenty of tabulations including some unique ones for "pre-distorted" designs that take into account
element value losses..

For a lot of very high level practical stuff on filter design, including transformations to get "nice" element value ranges,
some neat stuff on crystal filters, and some more tabulations see...

6. DeVerl S. Humphreys, "The Analyisis, Design and Synthesis of Electrical Filters", Prentice-Hall, 1970.
(Find it in your nearest technical library, shelved at call number TK782.F5H84)

And last but not least for the "best" practical explanation of it all, heh, heh...

7. Adel S. Sedra, and Peter O. Brackett, "Filter Theory and Design: Active and Passive", Matrix Publishers,
Champaign, 1978. (Shelved at call number TK7872.F5S42)

Enjoy!

Best,

--Peter K1PO

1) The sizes (dimensions)of the transmit and
receive antennas were reasonable for the BC band,

2) In the early 1920s receiver and transmitter
design and available components were OK for the BC
band frequencies, but not OK at short wave
frequencies.

A good example is FM, which was moved from the 40
kHz region to the 100 MHz region after WWII.
Technology improvements made it possible

I've considered one of two things: an SCR/Triac softstart circuit fro
the primary, that would ramp up the voltage over several seconds. Or
doing the series resisstor, but using sold state relays with a timing
circuit in the LV side. Goal, not to have mechanical relays going click
and thump.

Source record: 47460

Hi everyone!

I'm thinking about purchasing a White Mountain TRX, but my main activity would be on 21MHz. Unfortunately, most single band transceiver kits may cover 20m and perhaps 10m, but almost never 15m. Small Wonder Labs has at least a 20m version, but there is no schematic and in their introduction no word about the frequency processing.
So what I would like to ask is: Has anyone ever made a 15m version out of the common 20m version? Or can someone who built it (preferably the 20m version) tell me a bit more about the kit so that I have a better understanding of how difficult such a mod would be?

Future Electronics, in Canada, is the best supplier of Signetics parts, such as the NE612. The only catch is that you have a minimum order of at least one rail of them. This isn't too bad, since the last time that I bought some SA602s, I paid $1.26 each for them. That was around 60 dollars for the rail.

Pete

Phil, the best result I have ever seen for 'homemade' panels was done
with a router on an anodised (RadioSpares sourced) panel and the
routed letters were infilled with a black or white, depending on the
background, cellulose paint, If you are interested in the actual
method I'll relate the details via e-mail

Long wave less than 500 KHz was deemed necessary for long haul
communications.
Short wave more than 1500 KHz was deemed to be useless for serious
communication
and was assigned to amateur use. Broadcast was slipped in to that plan at
the shortest
wave length that was still useable.

That sounds like it would work great! Is there a minimum effective size for the sheet of metal, or a particular material that reflects best? I have no idea what the first two passive repeaters that you mentioned are, so I'm skipping those until I can find out more about them. ;) Would you happen to know of a reliable website where I could read up on passive repeaters?

Thanks, by the way, for figuring out an option that doesn't result in you yelling at me about the legalities of repeating. ;)

$75 ??? INSANE!

Even on ebay $40 is a more typical price. weren't they only $50
that last year before closeout ? I know I got my last couple for
$20 on closeout...

We have a few of these excellent handbooks left from the holiday sale.
Its the latest 23rd edition, the hardbound bible of builders and superb
classic reference
for all areas of interest to hams.

Bill/W6SAI lives on via his many gifts of articles and books. His
writing methods allow all levels of technical backgrounds to understand
and learn from his expertise.

The Handbook normally sells for $52.95, plus shipping and tax in state.
We're selling them for $39.95 plus a flat $5 shipping within the US 48.
That's $44.95 total! You can order online or call,fax, email.
Follow this link for more information:

239. Re: Passive LC filter design

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-09 21:56:02 UTC
From: "Peter O. Brackett" <ab4bc@ix.netcom.com>
Message-ID: <a1ie93uak1@nntp9.atl.mindspring.net>
Source record: 47480

Henry:

Thanks, Re your question, you might find the following helpful...

Actually that particular Butterworth formula due to Bennett, and lots of other references to various pieces of work on explicit formulae for LC filters can be found in Weinberg.

*** Louis Weinberg, "Network Analysis and Synthesis", McGraw-Hill, New York, 1962. LCCN 61-16969. ***

There is a complete well written section in his Chapter 13, "Practical Filter Design Made EAsy: Handbook Tables of Element Values and Ecplicit Formulas". The section on explicit formulas for LC filters is in Section 13.5 from page 651 -668. About 17 pages.

Most of the work on explicit formulas was published in various serial journals around the world over many years, and Weinberg has done us the service of collecting them all together, along with explanations, expositions, and lots of bibliographic material in the last chapter (Ch13) of his 1962 book.

The formulas are *simple* but the explanations are deep, mathematically sophisticated, and complicated!

Heh, heh... that's probably why the simple formulas are not so well known. They are buried in lots of math derivations! Such is the proclivity of the mathematically inclined!

Weinberg also outlines a number of remaining unsolved problems of explict LC ladder formulas that he notes are probably amenable to analysis and could be attacked and possibly cracked by a persistent researcher... Something to do on those long lazy hazy days of summer... heh, heh. However in these days of digital filters and C++ programming no one seems interested in explicit formulas for LC filters anymore.

That 1962 Weinberg book is probably out of print now, but it can be found in most good technical libraries, you should find it in the technical/engineering library stacks under Library of Congress Call Number TK3226.W395. The explicit formula topic cover only 17 pages in that last Chapter 13, it would be worthwhile to get the book and copy just those pages. At the end of that book, Louis Weinberg gives 13 different references, including Norton, Bennett, Takahasi, Orchard, Saraga, and many others, to the work on explicit formulas.

Best,

Phil

I have a freeware program at http://hfradio.org/wb8rcr

It is available for Linux or Windows command line. Source is available if you want to compile it for another operating system.

As a command line utility, it's a little clunky, nothing at all fancy, but you can lay out a decent panel pretty quickly, which is the objective after all.

..

Not if both the source and load impedance are positive real at the
pole frequency. A transfer function pole may exist on the imaginary
axis if at least one termination has a negative real impedance.

248. Re: Passive LC filter design

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-10 03:57:02 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <3C3D110E.ED2A09ED@eznec.com>
Source record: 47489

It only took a couple of minutes to come up with an example of an unterminated filter that has transfer function imaginary axis poles: a series L followed by a shunt C (or vice versa). At the radian frequency of 1/sqrt(LC), the response is infinite. But the input impedance is zero at that same frequency, making a rigorous analysis of the filter an exercise in the theoretical properties of impulses.

I was referring to open-circuit voltage transfer functions, which by definition assume an infinite load impedance and aren't a function of any source or load impedance that might be connected (unless the loads are considered to be part of the network). Of course, if a network did have poles on the open-circuit voltage transfer function imaginary axis, any connected finite load resistance would consume an infinite amount of power at the pole frequencies, so a source would have to provide an infinite amount of power. Which even an ideal source couldn't do through any finite amount of source resistance.

But as Bart says, you can get the poles of the filter-load combination onto the axis even with a positive termination resistance if you make the other termination negative. That's one common way of making an oscillator, with an active device providing the negative resistance.

My first novice transmitter used a single 6V6. It was from an article
in the 1949 ARRL handbook. I used mine on 40m, but it would be simple
to adapt the coil, etc to 30m. The one I made was from almost all junk
parts mainly from an old tube TV. Transformer, etc. The tuff part will
be finding xtals for 30m. I bet they won't be cheap if you have to
have them made. You won't be able to scrouge for old novice xtals like
you can for 80/40m. MK

As others have mentioned, it is possible to build a rotten,
crystal-cracking single-tube transmitter -- however, it doesn't -have-
to be that way. The key is to recognize that you have to trade power
for stability and low crystal current, and adjust the transmitter to a
much lower power level than if the tube were being used as an
amplifier. Set the feedback to a minimum, and the screen voltage down
to maybe half (just a starting point) the normal value.

Here's the ARRL 6DQ6 transmitter:
http://www.qsl.net/k3hln/6dq6xmtr.htm

If you can live with even lower power, a high-gain video pentode like
the 6AG7 or 6CL6 can be even more gentle on your crystals.

You should consider joining the glowbugs mailing list, which is
devoted to tube homebrewing of ham gear. From the guide to the radio
newsgroups:

> For homebuilding transmitters and receivers using tube technology,
> there is the Glowbugs e-list; send an email to:
> majordomo@piobaire.mines.uidaho.edu and only write:

Folks,

I recently purchased a signal generator from David Messing, K0RWM. It was one of the best mail order experiences I've ever had.

David checked out the generator for me in his home lab. It works perfectly, just as he described. It was reasonably priced, packed well, shipped promptly, and arrived right on time. His email correspondence was just great, every step of the way. He even provided the tracking number! (No one seems to do that anymore. Used to be the norm. It was a very pleasant surprise.)

I really enjoyed our transaction and our correspondence. He's a great guy. Would I deal with him again? You betcha!

So, if anyone ever has the opportunity to deal with David, rest assured that you will have a perfect, enjoyable transaction, and meet a terrific person in the process.

==========
The above is a socalled 'parrot repeater' probably equipped with Information Storage Devices Inc (ISD) direct analogue storage technology chips . The older models being the ISD 1000 series ,with ISD 1020A capable of storing up to 20 seconds of audio.
These ICs can be cascaded. In the USA they are/were also available in greeting cards complete with microphone and miniature speaker ,such that the sender could include a voice message.
Some time ago there was an article in QST on these devices.

Hello Al,

How about sending me the replacement Vacuum Relay you promised over a year ago, or my Money back? I replied and sent Emails to you numerous times over the last year and you just ignore me. I've got all your promise to replace or refund Emails on archive if you deny it.

So far, your word is not good to me. When you resolve our deal, I'll be happy to post that you did.

I'll be waiting...

If you want digital signals, the best way I know of is to start with a clock signal that is at 4x the frequency and feed it into a pair of D flip flops (single package) connected as a ring type shift register. The Q outputs of the two FF will give you perfect quadrature +/- digital noise.

The state table for such a circuit would be:

00
01
11
10

I leave it as an excercise for the reader to figure out the circuit. (I'm sure it's already posted somewhere on the Web anyway.)

Or....

You could look up any number of articles on phasing type SSB transmitters and copy the audio phasing network, which usually uses a bunch of resistors and capacitors. They aren't as good, however, and don't cover the frequencies you want so you will have to use different RC values.

259. Re: FRS repeater (construction or otherwise)?

I really don't know how the size or type of metal would affect the efficiency, but I would guess that that any metal would work; and the bigger, flatter and more rigid the better. Choice probably would be more dependent on how you have to mount it.

I don't know of a web page but search on "passive repeaters reflector" (no quotes) on Google, and you'll get more information on the subject than you'll ever want to know. Maybe some good ideas re construction.

Good luck.

If you can double the input frequency, you can use a couple of flip-flops,
and get your quadrature 5kHz-150kHz out.

264. Crystal Filter Question

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-10 22:21:05 UTC
From: Jack Smith <jsmith@mnsinc.com>
Message-ID: <1g3s3u4ov2p2nan1743veugm1imgeasm34@4ax.com>
Source record: 47406

This rambles a bit, but there's a question or two that require some setup.

A few weeks ago, I bought 300 crystals (13.500 MHz) for a few cents each, with the thought that I would try my hand at a few crystal filters.

I measured the average crystal parameters (using the technique suggested by Wes Hayward) as:

Rs = 1.92 ohms
Lm = 4.3048 mH
Cm = 32.321 fF
Ch = 6.2 pF

Using these parameters, I designed a 2 crystal and a 4 crystal filter 1 Khz bandwidth, Butterworth, and breadboarded them today. (For easy measurement, I also built an L matching network at each end to match to 50 ohm test equipment.) Also ran some SPICE simulations on the designs and all seemed OK.

First, the 2 crystal filter. I measured the 1 KHz response, and it looked almost like the SPICE simulation, 3 dB BW 910 Hz, a little tight, but not so bad. Passband looked just like it should, nice top. Ultimate rejection > 80 dB even with breadboard layout. Center frequency (minimum VSWR and also minimum loss) 13500.520 KHz, loss 2.2 dB, return loss 23 dB when filter output terminated with a good 50 ohm load.

I then put the filter on my network analyzer (an old HP8754A) and swept it out, using an outboard FM signal generator for better performance in narrow sweeps. Sure surprised me when I found a second passband, with a 3 dB bandwidth of about 200 Hz width (3 dB points), at 13578.880 KHz. The second passband was only 30 dB down.

I then swept a crystal by itself, and in addition to the normal series and parallel resonance points around 13500 KHz, I found two more series/parallel resonance points, up around the area where I found the second passband, between 75 and 100 KHz above 13500 KHz.

I concluded that the spurious passband is the passband caused by these secondary series/parallel resonance points coinciding.

Question: Anyway to kill this spurious? I have an application that I would like to use a 2 crystal filter in.

I then built the 4 crystal version, and no trace of a spurious response. All performs pretty much in accordance with the theory and SPICE simulations. I'm guessing that the spurious frequencies show greater deviation than the fundamental resonance points and that my first two crystal filter just had an unfortunate alignment of spurs. I'll run some more detailed individual crystal measurements tomorrow and try a different set of crystals in the two crystal filter, but I wanted to see if anyone had some experience in this area and could point me in the right direction.

You could generate it directly with an AD9854, but that's probably
overkill for the frequency range you're talking about.

As a cheaper solution, a fast PIC chip might be able to generate the
signals with software timing loops. I think Richard Hosking's site
(http://members.iinet.net.au/~richardh/VK6BRO.htm) has some PIC DDS
emulation code; it would only take a few more lines to provide a
quadrature output.

This looks awfully suspicious to me, I've NEVER seen a crystal with an Rs
that low. With the IL that you describe, could this be a mis-type and really
be 19.2 ohms?

200Hz offset shouldn't cause any problem when I use a 500Hz cw filter
in a contest, but I don't usually expects pile-ups

whatever tactic you wish to use it is important to know what you
do, you must you must know which frequency hit, if you moved the
opposite way would be bad tactic. My first intention was to make a
tool to simplify correct tuning whatever the tactic is

now I found another reference to similar interest, see
http://www.alltel.net/~johnshan/cw_ss_zerobeat.html

Randy Henderson's (WI5W) article in March 1992 QST (Do You Know Where
Your Signal Is?) eloquently described a long-standing shortcoming in
contemporary transceiver design

This is not exactly the construction I am looking for, believe my idea
is better, provided it can be easily achieved. One suggestion is a
center zero meter showing the tuning offset frequency, but need it to
display at least +/-200Hz

269. Technical Question on VOR Transmitter Specifications

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-11 00:17:13 UTC
From: "Barry L. Ornitz" <ornitzNO@SPAMusa.net>
Message-ID: <Zaq%7.1510$2V4.199338@atlpnn01.usenetserver.com>
Source record: 47410
Cross-posted to: rec.aviation.ifr,rec.radio.amateur.homebrew

These appeared to be the best newsgroups to ask these questions in because of the technical experience of the readers, although my questions are not directly related to flying under instrument flight rules nor to amateur radio. My apologies to those who think this post might be off-topic.

A VOR (VHF OmniRange) transmitter transmits a signal with an antenna system that produces a limacon (or cardioid) shaped pattern. This pattern is rotated either electrically or mechanically thirty times a second. On a distant receiver this produces a signal that is amplitude modulated at a 30 Hertz rate due to the rotation. The transmitter is amplitude modulated by an audio tone of 9960 Hz. This audio tone, actually more properly called a subcarrier, is frequency modulated with a 30 Hz signal. This is the reference signal and the phase of this signal coincides with the phase of the 30 Hz amplitude modulation when the receiver is due North of the transmitter. By measuring the phase difference between the demodulated AM and FM signals, the bearing to the transmitter can be determined at the receiver. The VOR transmitter can also carry other modulation such as voice or tone for identification purposes.

My question is: what is the modulation index (or alternately the frequency deviation) of the 30 Hz FM signal? It would be helpful to also know the percentage of the amplitude modulation also.

Thanks for any help.

270. Re: Crystal Filter Question

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-11 00:27:22 UTC
From: Jack Smith <jsmith@mnsinc.com>
Message-ID: <sobs3uc8ebgshak1f3ntpn3qbhln0qnmk7@4ax.com>
Source record: 47411

Good question. All the data I've seen suggests 10 - 30 ohms is the typical range.

My original measurement was based on calculating the series resistance based on voltage readings with the following configuration

SG100 --- [10 dB pad] -- [Xtal test fixture] --- [10 dB pad] --- [50 ohm thru term]-[HP3400A voltmeter]

This run yields 1.92 ohms. (Peaked the frequency of the SG100 to get the xtal series resonance frequency.) The voltage readings were based on the difference between a "through" connection and the crystal in place.

After reading your message, I reran my 5 test crystals, using the same arrangement, but a different method. This time, I set the signal generator (SG100) output to a reference level with each crystal in place. I then substituted a small trimpot (100 ohms maximum) and adjusted the trimpot to get the same voltage reading that I had with the xtal in place. Then, I measured the trimpot with an HP3468A digital multimeter, 4-wire mode. Here are my readings:

Xtal R ohms
1 3.25
2 4.23
3 3.91
4 3.60
5 4.10
Avg 3.82 ohms

I would trust this a bit more than my calculations, but it still isn't at the level one normally might expect.

Some of the filter loss at resonance will come from the two L pads.

But, I don't think Rs is connected with the spurious resonances of the crystals and the spurious filter response.

I agree with Harold on the Rs, but as far as the spurious response goes, I would expect that. I would imagine that you would have to come up with a new model and try to optimize the design via simulator using this new xtal model, but I'm not familiar with this in filters, only in overtone oscillators where you would basically shunt the Rs such that the Barkhausen critia were not met.

Good luck anyway.

If you are trying to generate quadrature signals as a SINGLE frequency within the 5 to 150 kHz band, start with 4X the desired frequency and use 2 D flip-flops as a twisted-ring counter. The 4 possible outputs (Q and !Q from each flop) will each give you the desired output frequency, each at a different 90 degree phase point.

If, however, you are trying to generate a pair of quadrature signals over a instantaneous bandwidth fron 5 to 150 kHz, you need a pair of networks, each consisting of a cascade of all-pass stages. Probably 2 or 3 stages per network for reasonably accuracy. Crossover frequencies of these networks are interleaved to give a 90 degree difference between then across the band.

Harold & Steve:

I ran two SPICE simulations with Rs = 2 ohms and Rs = 4.2 ohms and
compared the insertion loss with what I'm seeing with the 4 crystal
filter.

Measured IL 3.2 dB
Rs=2 ohms 2.0 dB
Rs=4.2 ohms 3.9 dB

This gives me reasonable confidence that the true Rs is in the range
between 2 and 4 ohms. Note that I've used infinite Q for the matching
L's in the SPICE simulation, so there's a half dB or so of IL due to
that not reflected in the SPICE numbers.

I don't think so, or at least I don't share your confidence. I haven't followed your measurement technique in that I don't recognize some of the equipment you describe, but it's very suspect in my book. I have made 18 pole filters with well under 2 dB IL with crystals with Rs 10-15 ohms. IL is quite dependent on filter bandwidth and I guess I haven't seen what you are designing to in that parameter either.

If you'd care to send me a couple of your 300 rocks, I'd be willing to characterize them with either/both a homebrew test box I made several years back, or a VNA. These two independent measurements have always yielded results within less than one percent of each other.

One thing that would give results like you're measuring is harmonic content in the generator. If that is high, the crystal selectivity gets rid of it in your measurement but the potentiometer doesn't and it looks like you have a crystal with a Q of zillions. Try installing a good BP filter on the output of your generator and see if the Rs goes up. If you measure the 3 dB corners of series resonance, what bandwidth are you seeing on a single crystal?

All filters have pop up. Some can be contained with termination impedances, some with additional poles, some with holder neutralization. I've deleted what started this thread and can't refer back to all of it.

Not to beat this to death, but I re-downloaded the first messages in the thread and reviewed them and have had some other thoughts. Could these possibly be monolithic crystal pairs? You might just carefully pull the cover off one and see whether the crystal has more than one set of plated contacts on each face of the rock.

My Understanding is that phasing systems typically get around 35 - 40 dB
sideband supression if everything is near perfect... The problem is usually
slight differences in the amplitude and phasing of the two audio channels.
Well, that, and variation in the RF 90 degree LO splitter that changes the
RF pahse shift from one end of the band to the other.....

And, there is some change over time and temperature that usually degrades
the supression by a few more dB as time goes by.

The audio tends to sound 'better' since it isn't filtered to be as narrow
a bandwidth as most crystal filter rigs.

==========

A good crystal filter type transmitter usually has better sideband
supression and it also doesn't change much with time and temperature. It
also lends itself to making a transciever more easily since the filters and
oscillators are already in place.

In theory, a phasing SSB generator can offer perfect opposite sideband suppression. If implemented in analog tech, things are never perfect, so perfect suppression can't be achieved. However, if you do the SSB generation in DSP, then you *can* have everything perfect (at least to the numeric limits of the DSP). Opposite sideband suppression can be at least 90 dB with existing (affordable) DSP tech.

Some commerically produced amateur transceivers are now using this method of SSB generation (at a very low IF). There are also a few kits and construction projects for the do it yourselfer. One advantage of using DSP for this is that once you have an I/Q style modulator, you can use it to generate *any* arbitrary modulation form (AM, FM, SSB, PSK, FSK, etc) with only a software change.

A low IF DSP modulator/demodulator can be built for under $50 in quantity one from off the shelf parts (much cheaper in mass production). It hardly makes sense to spend the money for a crystal filter type SSB modulator today. The filter alone would cost more than the entire DSP subsystem.

(Of course you may want a filter anyway, on the receive side of a transceiver, to reduce the required dynamic range of the DSP by suppressing out of passband energy at the input to the DSP. But this filter can be less expensive than the one needed for classic filter/product detector designs, because the DSP can do a lot of the filtering while also doing the demodulation.)

The mention of a 6V6 reminded me of a project that I saw in one of the hobby magazines like "Electronics Illustrated" where the author used the tin box from a pack of Ludden's cough drops and put the xtal socket, components, and the 6V6 socket inside the tin box. At the time, being only 13, I thought
that was the neatest thing that I had ever seen (John Glenn's ride took that place later). :-) I wonder if anyone else remembers that one?

I agree also on the xtals. Perhaps another project using a 6CL6 VFO in a Ludden's box? The hang up there is getting the variable cap, but you could cheat a little and use a varactor comprised of 1962 circa diodes such as the 1N62 or such. Engineers, I know that the example is germanium, but I'm just throwing ideas up in the air. After all, we are seeking a new paradigm. :-)

The limitation for SSB on opposite sideband is set by the linearity of the power amplifiers. For a conventional amateur rig this limit is about 40 to 50 dB below PEP within the audio frequency range of the opposite sideband.

Am I correct in assuming that the energy in the opposite sideband caused by nonlinearity wouldn't be an image of the desired sideband, but a jumbled mass of intermodulation products from the components in the desired sideband? And that you'd have a similar mass on the other side of the desired sideband?

The brief comments above need some clarification.
Consider USB. The opposite sideband (LSB)
contains the following:

1) LSB products that are due to the IF filter
response below the carrier frequency. That is, LSB
output from an USB xmtr. My spectrum measurements
show 40 to 60 dB reduction of these products using
a filter-type rig, depending on how far below the
carrier they are.

2) Distortion products generated directly by the
PA. These are not filtered by the SSB filter. The
typical adjacent channel "splatter" generated by a
speech signal is a gross example, but some of it
is present even in a fairly "clean" transmitter.
This is a pseudo-noise output.

3) Wideband white noise created by the amplifier
chain that comes after the SSB filter. Definitely
not negligible.

4) L.O. phase noise with the usual "Xmas Tree"
spectrum shape.

All of these are received within the passband of
an SSB receiver that is tuned to the lower
sideband. This receiver also has reciprocal

mixing due to its L.O. phase noise.

The receiver is *integrating* all of the stuff that is in the LSB within a 2500 Hz bandwidth. The total of all of that is typically in the range of 40 to 50 dB below PEP for a medium performance SSB xmtr, and 50 to 60 dB in commercial xmtrs.

In view of all the sources of garbage in the LSB, an infinite LSB rejection in the SSB generator is not really justified, so far as SSB is concerned.

Chapter 17 of the ARRL Handbook, 1995 or later, also has a discussion of this topic.

Source record: 47430

Harold:

I'm posting 5 samples to you this morning, marked A through E. (My original 5 samples are numbered 1...5.

Here is what I measured this AM using a GR916 RF bridge. I first adjusted the frequency so that reactance = 0 ohms, which should put me reasonably accurately on the series resonant frequency:

Delta F is zero reactance frequency difference from nominal 13500.000 KHz.

Xtal Rs (ohms) Delta Frequency Hz
1 4.55 -15
2 4.20 -70
3 5.00 +15
4 4.30 +85
5 4.20 +45
A 4.10 -65
B 5.40 -145
C 4.15 -15
D 4.55 -70
E 4.60 +40

I didn't measure Cm, Lm and Ch for A...E.

I haven't checked the signal generator time base recently, so it could be off a few Hz one way or the other.

A check of the 916 bridge against several precision 50 ohm RF loads shows it is within 1% at that resistance.

I disassembled one crystal to check your question. It has one plated contact on each side. These are cold welded crystals, not soldered, so I had to carefully cut the base off with a jeweler's saw.

If you would like, I'll e-mail a photo of the disassembled crystal.

Some homebrewers must use eCAD and produce schematic and netlist files etc to produce PCB layouts.

It's not so simple to do, because eCAD makers tend to arrange file formats specific to their eCAD programs, but do folks ever swap their files, so others can benefit?

I'm interested in building a homebrew MW (Broadcast band) rx where a PCB is available, or in files that I can use in an eCAD program, so I can make my own PCB's that particular way. (I'm wanting to gain experience of using eCAD in production of PCB layouts, but where the schematic and layout has been done already).

HI.

I hope to build a decent 40 meter receiver (73 Amateur Radio Today/FEB99 by Thomas Duncan). I have the two boards from FAR Curcuits and a very poor photocopy of the article in 73 magazine. I can't really read the schematic.

I have only been able to find a few of the parts locally and so I will have to order over the internet or from catalogs perhaps?

I would appreciate hearing anyone who knows where to buy homebrew parts. And from anyone who has built the receiver. Also need a decent photocopy of the article or schematic.

Thanks in advance for the help. Email is tincansailor@hotmail.com
This is my first homebrew attempt and I am a little bit overwhelmed.

Don't forget polyphase shifting networks as opposed to the two-chanel types. They can acheive a much better sideband suppression but there are losses associated with the network. However according to a 1995 QEX article, instead of choosing a single value resistance or capacitance throughout the network, if you vary resistance and capacitances from column to column in the right way it is possible to obtain a flat response. I have built an 8-stage network using 0.1% resistors and capacitors also matched to within 0.1%. The values are calculated according to the QEX article. I have as yet not properly measured the response of the network, but at one frequency (1.8 kHz) looked at so far, the network actually showed a gain of 4dB with the values I used. I plan to use a Huff & Puff stabilised VFO at 56-64 MHz, to divide by 4 for coverage of 160m, 80m, 40m and 20m bands, driving a Tayloe switching detector. My Huff Puff VFO Stabiliser information page is at http://www.hanssummers.com/radio/huffpuff/contents.htm and details of my Huff Puff VFO circuit are at http://www.hanssummers.com/radio/huffpuff/fast/index.htm. At the bottom of this page is a photo of my polyphase network, though I have since then added the Tayloe detector and a 160m bandpass filter.

Jim:

I have a scalar network analyzer and have a good view of the center
frequency and passband shape of the filter.

The question started out concerning the spurious mode in both the 2
cyrstal filter and in the crystals themselves. It then drifted into
"what is the series R of the crystal."

the original question remains "is there a way to remove the spurious
mode in the resulting filter?"

What do you mean by quadrature, for every possible instantaneous phase amplitude vector or is there a single carrier that varies as you tune something? If it is the former it would be tricky considering the bandwidth ratio. You might consider DSP. The latter can be solved with a PLL.

Typically at higher frequencies, you could use a 90 degree hybrid splitter.

There is a way to get an arbitrary phase shift with constant amplitude. First make an inverter to you have two signals 180 degrees out of phase (you could do it with a transformer or an active circuit) , sum these, one through a capacitor and one through a variable resistor and you get a variable phase shift. Problem is, the phase shift varies with frequency so if you don't want to adjust the circuit depending on frequency, you will need to incorporate some form of zero phase shift frequency dependent resistor, an FET perhaps.

No need, I know what the innards of a crystal look like. Just a shot in the dark since most monolithics have a third lead for the coupling plates. I have seen some though that used the case itself for that lead and thought you might have tumbled onto a bunch of those particularly since they were such a good buy.

I'll be interested in trying a couple out. Have you checked on the harmonic content of your signal source? About the only thing I can think of that would lead to such a low Rs reading other than just plain coupling around the crystal.

Harold:

I used a DDS-based function generator for the signal source, since it has resolution to 0.01 Hz. Its harmonic performance and spurious performance in general isn't all that good, but my bridge measurements used a Racal 6790/GM general coverage receiver for the null detector, so source harmonic shouldn't be an issue.

Harmonic or spurious could be an issue with the HP3400A meter used as a detector when I used a trimpot substitution, since it's broadband up past 20 MHz. But, I got the same results when I used a spectrum analyzer as the detector. (The 3400A is easier to see a fraction of a dB change compared with the 1 dB/div SA display.)

So, it will be interesting to see how much difference there is between my measurements and what you find.

From: n7ws@yahoo.com
Message-ID: <3c3f12dd.90174286@news.triconet.org>
Source record: 47440

On Thu, 10 Jan 2002 22:21:05 GMT, Jack Smith <jsmith@mnsinc.com> wrote:

|This rambles a bit, but there's a question or two that require some
|setup.

I will ramble a bit too and interject random thoughts
|
|A few weeks ago, I bought 300 crystals (13.500 MHz) for a few cents
|each, with the thought that I would try my hand at a few crystal
|filters.

These are probably not high quality rocks
|
|I measured the average crystal parameters (using the technique
|suggested by Wes Hayward) as:

Is this method the one described in "Introduction to Radio Frequency Design"?
|
|Rs = 1.92 ohms
|Lm = 4.3048 mH
|Cm = 32.321 fF
|Ch = 6.2 pF

As others have stated, Rs looks low.
|
|Using these parameters, I designed a 2 crystal and a 4 crystal filter
|1 Khz bandwidth, Butterworth, and breadboarded them today. (For easy
|measurement, I also built an L matching network at each end to match
|to 50 ohm test equipment.) Also ran some SPICE simulations on the
|designs and all seemed OK.

Are these lattice or ladder filters?
|
|First, the 2 crystal filter. I measured the 1 KHz response, and it
|looked almost like the SPICE simulation, 3 dB BW 910 Hz, a little
|tight, but not so bad. Passband looked just like it should, nice top.
|Ultimate rejection > 80 dB even with breadboard layout. Center
|frequency (minimum VSWR and also minimum loss) 13500.520 KHz, loss 2.2
|dB, return loss 23 dB when filter output terminated with a good 50 ohm
|load.
|
|I then put the filter on my network analyzer (an old HP8754A) and
|swept it out, using an outboard FM signal generator for better
|performance in narrow sweeps. Sure surprised me when I found a second
|passband, with a 3 dB bandwidth of about 200 Hz width (3 dB points),
|at 13578.880 KHz. The second passband was only 30 dB down.

|
|I then swept a crystal by itself, and in addition to the normal series
|and parallel resonance points around 13500 KHz, I found two more
|series/parallel resonance points, up around the area where I found the
|second passband, between 75 and 100 KHz above 13500 KHz.

Yep.
|
|I concluded that the spurious passband is the passband caused by these
|secondary series/parallel resonance points coinciding.

Probably. Strictly speaking, "spurious" response is incorrect, these are real responses. In crystal spec terminology, these are called "unwanted" modes (although some manufactures do call them spurious). They result from (among other things) problems in processing the quartz blanks.

In the old MIL specs, (MIL-C-3098, later MIL-PRF-3098) states, "all unwanted modes shall have a resistance that exceeds two times the main mode resistance."

So, the presence of these modes is anticipated.

Unfortunately, they are most troublesome in filter applications. In oscillators, the limiting action tends to suppress them, if you can get the damned thing running on the correct resonance in the first place :)

|
|Question: Anyway to kill this spurious? I have an application that I
|would like to use a 2 crystal filter in.

I would think this would be difficult, if not impossible.

|
|I then built the 4 crystal version, and no trace of a spurious
|response. All performs pretty much in accordance with the theory and
|SPICE simulations. I'm guessing that the spurious frequencies show
|greater deviation than the fundamental resonance points and that my
|first two crystal filter just had an unfortunate alignment of spurs.
|I'll run some more detailed individual crystal measurements tomorrow
|and try a different set of crystals in the two crystal filter, but I
|wanted to see if anyone had some experience in this area and could
|point me in the right direction.

Another thing that can bite you is the fact that crystal parameters are drive level sensitive. You need to make some measurements with different drive powers and see whether your answers are consistant.

When I was still employed, I developed a measurement technique using an H-P 3577 VANA and homegrown software (HP Basic on a 9836). The '3577 could sweep not only frequency but output power. One test I implemented would start measuring at very low drive (-40 dBm as I recall). The Fs, ESR, and unwanted modes would be measured and then the drive increased by a desired increment and the parameters would be remeasured. This process would be repeated until the max permited crystal dissipation was reached and then *the process would be reversed*, i.e.,

the power would be stepped down in the same increments.

If the data were plotted; ESR, Fs, etc. v. drive level, often times a hystersis would be noted. Starting at low drive, the ESR would start off high and decrease to a minimum (sometimes again increasing at higher drive) and then when the power sweep was reversed, the ESR would stay at a low value all the way back down the power sweep. These are known as "lazy" crystals.

One believed cause of this is that impurities that have settled on the crystal blank during non-operation are driven off once the crystal starts vibrating. The ESR is primarily due to the mechanical friction so the additional "loading" of the impurities causes it to be greater.

The kicker in this is that the unwanted modes don't necessary behave the same as the primary modes (particularly over temperature). Fun huh?

Another problem with extracting the motional parameters is that the shunt capacitance distorts the series resonance curve. The true series resonant frequency (defined as zero phase shift) is not the same as the minimum impedance frequency.

Using software and the built-in trace math capability of the '3577 I would measure the shunt C at a frequency far removed from resonance and then "tune it out" with a mathematical "shunt" inductor. Over a narrow frequency range near resonance the slope of reactance v. frequency was now linear and can be determined by taking a few samples. The motional parameters could then be calculated.

This work was done back when the only PC's in the facility were on the managers' desks. Therefore most of the data processing was done in the instrument. Today, I'd probably do it in Mathcad or Excel (although the latter is a mess with complex numbers)

I found it easier to measure the crystals as a one-port, rather than two-port device. I could then do a full open-short-load calibration with the fixture in place. Most of the crystals I tested were either TO-5 or surface mount and I used empty packages to build cal standards.

[snip]

The "device" of which you speak, is called a wideband 90 degree phase splitting network. a.k.a. Hilbert Transformer.

In theory such a "perfect" device is impossible to implement precisely since it implies a certain non-physicality. However for enough money one can approach the ideal phase splitter closely.

An approximation to the 90 degree phase separation can be achieved within specified error tolerances... e.g. phase separation of 90 degrees +/- and error of epsilon degrees, over any band of interest. The "cost" of such devices goes up *very* quickly as epsilon approaches zero, and as the bandwidth becomes wider! The looser the phase deviation spec and the narrower the band over which you want matching the better off you are!

You have not given any specifications in your posting on the degree of matching required over your band. But... I can say that your desired bandwidth, 5 - 150kHz is within the realm of possibilities with today's technologies, however, it is on the *extremely* wide side, in terms of relative bandwidths, for such devices. In other words, you'r probably not talking amateur $$$, but professional stuff because of the prices...

Unfortunately... there are no such devices, that I am aware of, which are "ready-made" for your frequency range. In fact most of the commercial off-the-shelf phase splitting devices, which were generally simple but precision matched R-C networks for voice-band/SSB generator applications, went out of prodcution many years ago, e.g. B&W, etc...

It is possible to design and build such a device, but... that is a non-trivial exercise, and definitely requires computer aided design tools, which are not widely available since there is so little call for such an application!

Since you have not elaborated on your problem, I will assume that you are looking at one of two scenarios...

A completely analog phase splitter, or a completely digital phase splitter

The latter means that you have already assumed/underwritten, all the costs of A/D converters, etc... if so then there may be some hope in coding your own DSP algorithm for a wideband Hilbert Transformer.

It's probably easier for a non-specialist, who is a DSP jockey, to design and implement a "digital" phase splitting device, known to the DSP filter guru's as a Hilbert Transformer, since Hilbert Transformers have well known DSP implementations, that can almost be "transplanted" into a programmable DSP engine. However if you are seeking accuracy of less than 1 degree peak to peak error across that 5 - 150 Khz band, the floating point MIP's that such a DSP algorithm will chew up will most likely dwarf the rest of your application. Count the cycles and check it out before committing!

If you are after an analog device, well I am afraid that... you are in for an even tougher time... The design of precise wide band analog phase splitters is almost a black art (Such a design involves first solving mathematical approximation problem using very advanced optimization techniques, and then the implementation requires advanced network synthesis techniques to implemtent accurate high order matched all-pass networks, either passive or active implementations, using all-pass LC lattice networks, or active RC all-pass networks.) In my experience I have only ever seen such networks developed for advanced surveilance radar video applications, and for advanced passive sonar front end applications, both of which were/are related to military sensing technology. Not cheap! Such technologies and methodologies are known only to a very few practicioners around the world, and they have developed their own proprietary computer aided design tools to do so, for one or two military sponsored programs. And so... unless you have big bucks to spend... and know who/where to consult with, you'r probably out of luck. You'l have to do it yourself.

And so... unless your design has *very very very* lax specifications on phase accuracy... I am afraid to say that your project might be out of reach.

Sorry,

It depends on how far out from the carrier you look. Usually the carrier is set at around 20 db down the filter slope. So at low frequencies, if the audio response is not limited, the opposite side band will be down only 20 db near the carrier. As you go out, higher audio frequency, the suppression gets better.

As a side note, a phasing type generator will have products show up on the opposite side band from 2nd order distortion products in the audio. 3rd order products do not show up on the opposite side band but do on the wanted side band. I think I have that right.

Need some guy wire clamps typically used with TV antenna installations. They are the three piece style that attach around the mast. Seems they are out of production and aren't sold at Radio Shack, Lowe's, Home Depot, Wal-Mart, K-Mart, etc. Any leads would be appreciated.

Peter,

Thank you for the reply.

I am doing this for the love of it to be sure.

I want to understand the math.... that gets all the way to the component tables.

I am making great progress.

The microwave text I have started from was the first book that I had ever seen that spoke to filter synthesis.... I bought it sight unseen because I wanted to learn more about microwave circuits.

I'll check out your links and references, thank you. and maybe hit you up with a few questions.

Kindest regards,

Clyde

The 5386 has a very expensive prescaler assembly installed
in an otherwise mundane counter chassis. Because of this,
there would be an incentive to cannibalize any nonrepairable
5386 to get the prescaler (assuming it was still good). So you
shouldn't assume it is going to be easy to get the prescaler.
If you do, I would suggest that you simply use it externally
to drive any suitable counter.

The 5385 used a divide by 10 prescaler while the 5386 used
a divide by 4 or 8. Therefore, you are not going to be able
to get the counter to read the actual frequency (you will have
to do the math yourself). And forget trying to modify the
firmware. You might be able to do something wierd like
using a 12.5 MHz external timebase to get it to read right.

The 5386 prescaler is vastly superior to any other prescaler
appearing in an HP counter. The one in the 5385 is actually
fairly finicky; for example, it was tested on the production line with an
HP 8660 synthesizer, but required a high pass filter to prevent
the high noise floor of the 8660 from corrupting the measurements.

BTW, I worked for the HP Santa Clara Division (where counters
were made) for 19 years and was project manager for the 5334B
counter. Now with Agilent Labs in Palo Alto.

Watch crystals are 32768 Hz so a simple 14 bit binary counter can
generate a 1 Hz clock. Your figure is 6 kHz high.

Hello all,

I would like to know this:

If a person took out all of the IF transformers in a salvaged AM/FM radio, is is possible he could find out which can would be the 455 kHz IF transformer by just using a DVM and an inductance meter? Color slugs sometimes don't agree with said frequencies.

a friend, Patrick

Thats a very tricky question. There's a number of rules of thumb that would give results. I forget all the typical colors but if you sort them out in a particular radio you will probably fall upon a scheme. Spotting a 455kc IF xfmr in a boombox is child's play. If your intention is to jap one for another project, it is often simpler to start from scratch and mail-order one that is guaranteed to have specs to your liking so as to limit the tinkering and frustration time Cost should be less than a pound/euro/buck.

Greetings,

I'd like to thank all of you who visted the website(http://www.sauderelectronics.com) and ordered, what great support the online community has shown for the site and its products. To answer many of you: Yes, the prices on the items are not introductory, they will remain the same as long as our customers(you) continue your great support. I'd specifically like to thank Frank Leaf who was extremely helpful in our online endeavor and volunteered to help with website improvements.

So, with no further ado, I announce our January USENET only specials! These specials are not posted anywhere else(except the website) and were designed for everyone who has supported our effort thus far:

1. Pack of 10 Silver Teflon PL259s for ONLY $8.00!
2. SMA Adaptors, mix and match, 3 for ONLY $10.00!
3. UHF SO239 3" Mag Mount, $2.00 off the regular price of $15.00 for ONLY $13.00!
4. Any order over $25.00 receives a special mystery gift FREE!

Order now at http://www.sauderelectronics.com

Thanks, and 73's

-Ben

That's right for a *filter* rig. But a DSP phasing rig can offer the same good suppression at the lowest audio frequencies as it offers at higher audio frequencies. In other words, it isn't limited by the slope of a filter's response characteristic. The Hilbert transform used is frequency invariant. To compensate for the poor suppression at low audio frequencies, most filter type SSB rigs band limit the audio modulation, suppressing the lower frequency voice components before sending them to the modulator. It isn't necessary to do this with a DSP phasing modulator.

For *communications* quality speech, eliminating the lower frequency audio components isn't a detriment, but it can be for other purposes (for example SSB SW broadcasting, where best practical fidelity is desired, or for the current amateur rage for high fidelity audio). Other operating modes than voice can also benefit from the better fidelity (examples, PSK31, SSTV, etc).

>> 2) Distortion products generated directly by the
>> PA. These are not filtered by the SSB filter. The

>> This is a pseudo-noise output.
>
>I assume that you are referring to 3rd order IM products here.

This is an argument for better PA linearity. The usual amateur practice
of trying to get the maximum output out of the smallest cheapest amplifier
tends to make this worse than it has to be. It is possible to do considerably
better than usual amateur practice, and do it with good efficiency too. As
example, our Harris Gold Line broadcast transmitters use very high efficiency
switch mode amplifiers which provide excellent fidelity at the cost of an
increase in amplifier complexity.

>> The receiver is *integrating* all of the stuff
>> that is in the LSB within a 2500 Hz bandwidth. The

>>
>> In view of all the sources of garbage in the LSB,
>> an infinite LSB rejection in the SSB generator is
>> not really justified, so far as SSB is concerned.

As you say, *all* of these spurious products are integrated by the receiver.
Reducing any one of them improves matters. In other words, you can't output
a cleaner signal than is input, so you want to start with the cleanest practical
input. Attacking every source of spurious after the modulator can improve
matters even more.

(It should be noted that *atmospheric* noise is typically the limiting factor
at HF. Reducing spurious below that noise floor is of little benefit except to
nearby stations, where the near-far relation makes even relatively low levels
of spurious of concern. The FCC permits a higher level of spurious output
for HF rigs than for VHF+ rigs, but in today's urban areas we need to be
concerned about the effects we may be having on our amateur neighbors.)

More to the point here, though, is that it has become cheaper to generate
high quality SSB using a DSP I/Q modulator than it is to do it with a
conventional filter type modulator. So, even if the improvement in spurious
were to be small in practice, it is now more cost effective to use the phasing
approach. Plus, use of a I/Q modulator offers other benefits to the operator
which are essentially "free" with this approach, ie an I/Q modulator can
do any arbitrary modulation form. This is of practical interest to amateurs
who wish to use any of the several newer communications modes. Instead
of trying to jury rig things at audio and push it through a conventional SSB
modulator, you can generate the signals directly in the modulation process,
with better fidelity and likely lower total system cost and complexity.

>mode in the resulting filter?"
>
>Jack K8ZOA

Minimization of spurious responses was one of the early advantages of
ladder filters. From:

| Hardcastle, J. A. 1978. Some Experiments with High-Frequency
| Ladder Crystal Filters. QST. December. 22-41.

"Early attempts by the author to make high-frequency crystal filters
.. suffered from ... numerous spurious responses immediately adjacent
to the hf cut-off frequency.

"Ladder type filters are not so vulnerable to the effects of the
additional series resonances present in the crystals. This is so
because of the unlikelihood of these resonances occurring at identical
frequencies in all crystals."

Another important issue is the use of inductors across each crystal to
cancel crystal holder capacitance, as described in:

| Hayward, Wes. 1995. Refinements in Crystal Ladder Design.
| QEX. June. 16-21.

The resulting filter is *symmetrical*, and asymmetry of response has
been one of the classic problems. I have verified the improvement by
simulation. The author says:

"The scheme that is used to cancel Co, the parallel crystal C, is to
add inductance in parallel with the crystal, creating a parallel
resonance with Co. The inductance is made a bit smaller than needed
and a small trimmer capacitance is added, allowing for easy
adjustment.

"The added inductors are wound on ferrite toroids. This was required
for this low frequency filter [3.58 MHz]; the needed 150uH inductance

was not practical with iron-powder toroids.

"The only subtlety encountered was adjustment of the trimmer capacitors. I eventually shorted all four crystals with pieces of wire. Then the crystals were individually unshorted, the related capacitor was adjusted for a deep null about 20kHz away from the passband, and the crystal was again short circuited."

Yet another issue is that modern QRP designs (e.g. "Wilderness Radio Sierra" among others) use varicaps instead of fixed capacitors to ground. This is intended to provide a simple width control. My simulations show that this is remarkably effective, except that it changes the filter impedance, which has a major effect on passband ripple. If we could also vary the load and/or drive impedance to match the filter, or maybe just vary the innermost capacitances to minimize change in the externally-seen impedances, maybe this could be improved.

This discussion, for me, pertains only to Amateur Radio. In this environment, economics and the cost-of-ownership (already quite high for many, which is probably why QRP and boatanchors are so popular) do not lead to extremely low levels of out-of-band emissions from the transmitter (due to all causes) or extremely low levels of susceptibility (due to all causes) in the receiver.

The receiver, tuned to the LSB, is an equal contributor to the LSB garbage because of its reciprocal mixing and its selectivity (which extends somewhat into the high-energy USB channel).

Despite the so-called Hi-Fi SSB clique who want to hear 15 Hz (all of which is nonsense, in my personal opinion), amateur SSB is a voice comm mode in which 300 to 3000 Hz is, and should be, the desired band. Frequencies outside that range can, and should be, attenuated very considerably.

The receiver cannot be ignored in the system analysis. It is just as important to the total "channel" as the transmitter.

Also, in transmitter or receiver, DSP is (and will be for a long time except for flea power systems) far removed from the antenna, and that provides a lot of opportunities for degradation of the signal, transmit or receive. I am familiar with the sales pitch for DSP, and that is OK, but like so many things it has been hyped beyond its *real* value.

As a practical matter, filter rigs that use high quality filters (xmit and rcv) provide out-of-band quality that is more than adequate, considering

the *entire* picture. It isn't true that there is only "one way to go" and all other ways are "just plain dumb".

No, I am not dwelling in the past, I am in the year 2002.

An inductance meter would work ok; the main thing is removing the transformers from the radio. I have been ordering the ones that I need from places like Digi-Key. One transformer that works well is the Toko RMC502 182; the Digi-Key part number is TK1305-ND. This transformer works well as a coupling transformer with the MC1350 chips, and as an oscillator transformer with the NE602, when using this device as a product detector for SSB.

The entire issue of opposite sideband rejection can be rendered rather moot, if one uses the "Weaver" or "3rd method" of generating SSB, which is a variation on the phasing scheme.

In the Weaver method, you have the advantage that the desired and undesired sideband occupy THE SAME frequencies (they are overlaid on each other).

Thus, imperfect undesired sideband rejection doesn't fall on an adjacent channel, but instead appears as a slight increase in distortion in YOUR OWN channel. However, if that distortion is 40-50 (or more) dB down, which is pretty reasonable, it will be of little or no consequence.

This is true only if the two required lowpass filters are ideal boxcar FIR filters, which is the same as the requirement for conventional SSB using the phasing method. The Weaver method is no panacea either.

I agree that power in the measurement is important. In some work I did a number of years ago on a modem product I was in contact with an industry expert and his claim was that I should specify a maximum power as low as possible, maybe 20 microwatts (I forget the value) and not 2 milliwatts. His assertion was the good crystal manufacturers will have no trouble manufacturing such a device and I will get a better crystal. The not so good manufacturers would complain. He advised that I should operate the crystal at the lowest power that will allow it to oscillate.

Could the original poster be clobbering the filter with so much power that undesirable resonsonce is seen, and that in actual operation it will not?

Can anyone here describe the method Wes Hayward used to measure the crystal parameters?

On this page is the method I have used... comments?

I can't point you to a schematic, but you used to see articles about
oscillators that would help you sort out IF transformers and coils.
The oscillators would be of such design that they would operate over
a wide range of frequencies, with the frequency based on an external
LC circuit. So you'd connect the unknown IF transformer to the terminals,
and listen in your general coverage receiver for the signal. You might
have to do some sorting to make sure you had a fundamental frequency
and not a harmonic, and you'd most likely just get a frequency in
the general range, but it sure would separate 455KHz transformers
from 10.7Mhz transformers, and also those oscillator coils that reside
in the same sort of case.

If you don't have a general coverage receiver, you could make a couple
of oscillators, one at 455KHz and one at 10.7MHz. Crystal controlled
would be handiest, but such frequencies are relatively difficult to come
by. Then you feed the output of one oscillator through your IF
transformers, one at a time, with a diode detector on the output winding,
feeding your DVM (or just some 200uA or so meter out of a junk piece
of equipment). The transformers that are at that frequency will should
give a higher reading on the meter than the other transformers. (If you
had a wide-range signal generator, you wouldn't have to build the
oscillators, but you wanted a minimal equipment solution.)

Another scheme is to trace out the wiring of the radio before you
take the transformers off the board. This may not be feasible some
or a lot of the time, because it depends on the circuit of the radio.
But if you can find the IC in the ECG replacement guide, there might
be enough information to help you sort out the transformers, or
at least reinforce the validity of the transformer color code.

========
If you can't get these clamps try 4 stainless steel 'jubilee' hose clamps
,with one around the mast and the other 3 as lugs tied (under 120 degrees
each) by the first one . Perhaps not a very elegant solution but probably
effective.
Instead of the 3 clamps used as lugs you might find 3 metal rings ,clamped
to the mast by 1 hose clamp.

I don't think economics plays much of a role for most people
in the decision to operate boatanchors or to homebrew. I think
that cost sensitivity is more of an issue for manufacturers of
mass produced new equipment. In any event, the DSP I/Q
modulator approach has become the cheaper alternative to
a good quality filter type modulator.

The use of higher linearity PAs remains something of a daunting
problem for the users of *any* type of SSB modulator. A high linearity
PA remains either complex or inefficient compared to the methods
ordinarily used by amateurs. But it is something that amateurs should
be considering in today's crowded conditions. It can be achieved.

>Despite the so-called Hi-Fi SSB clique who want to

>can, and should be, attenuated very considerably.

I don't disagree, but people use SSB type transmitters
for other things than voice communications. So the
advantage of better sideband suppresssion at the
lower modulating frequencies is a nice benefit, as is
the ability to directly generate other modulation forms.
And there's no cost penalty to be paid for those features.

>As a practical matter, filter rigs that use high
>quality filters (xmit and rcv) provide out-of-band
>quality that is more than adequate, considering
>the *entire* picture. It isn't true that there is
>only "one way to go" and all other ways are "just
>plain dumb".

I agree with you there too. I was just pointing out
that the DSP phasing approach can match or better
the performance of a good filter modulator, and can
cost less too. Better *and* cheaper is a hard
combination to beat.

Also, the DSP approach eliminates the concerns
about temperature sensitivity and component
variations that plague the analog phasing approach.
It can't get "out of adjustment". The phasing approach
almost dropped out of sight for years because of those
problems, but a DSP I/Q modulator solves them. This
has little application for the boatanchor operator, but
it should be of interest to the homebrewer.

No, it isn't the same. The Weaver method requires
more computational complexity than simply generating
a Hilbert transform.

Wes:

Very interesting and thanks for the detailed reply.

On Fri, 11 Jan 2002 18:48:16 GMT, n7ws@yahoo.com (Wes Stewart) wrote:

>
>Is this method the one described in "Introduction to Radio Frequency Design"?

My original measurements were based on feeding the crystal with a 50 ohm source and load and measuring the 3 dB point. This is described by N2DCH in "Ladder Crystal Filters" as being from your 1982 QST article.

Today, I built the osc/emitter follower test circuit described in your 1995 QEX article and remeasured my 5 test crystals. I found Cm values about 50% below those I calculated from the 3 dB data, and Lm about 50% above the 3 db calculated values.

I haven't determined why such a great discrepancy exists, between the two methods, but I'll work on that tomorrow.

>

>

I did a bit of library research and found an interesting comment in "Hy-Q Handbook of Quartz Crystal Devices," David Salt (Van Nostrand Reinhold (UK), 1987.) The responses just above the series resonance point are due to "inharmonic modes." Zverev's Handbook of Filter Synthesis says that the solution to these undesired resonances is to use more crystals in the filter and that since the undesired resonances seldom coincide in frequency, the result is satisfactory. So, I seem to have rediscovered the fact that crystals are the nice linear things I thought they were a week ago.

>If the data were plotted; ESR, Fs, etc. v. drive level, often times a hystersis

>down the power sweep. These are known as "lazy" crystals.
>
I ran a series of Rs measurements at different drive levels, using the
trimpot substitution method that I believe you described in one of
your articles.

I found quite a change with Rs versus drive. (I used a 6 dB pad on the
crystal input, so the actual crystal drive level is 6 dB below the
signal generator output.)

Sig Gen Out (dBm) Rs (ohms)
-50 48.22
-45 18.55
-40 8.862
-35 5.926
-30 4.851
-20 4.236
-10 4.176
0 3.860
+10 3.914
+15 4.200
+18 6.370

(The three decimal places are from the ohmmeter, but the basic
substitution method is probably +/- 5 percent, considering all the
variables.)

As far as whether the spurious in the 2 crystal filter are a product
of drive level issues, as KA1CRV suggested, I don't think so, I
watched it on a spectrum analyzer as I swept a signal generator over
it at -30 dBm or thereabouts. It looked the same on the network
analyzer at 0 dBm.

If you pry back the little metal tabs that hold the shielding can on,
the difference between the 10.7 MHz and the 455 KHz should be obvious-
there'll be less wire on the higher frequency ones.

That looks pretty sharp...

I had not thought of this before, but silk screening is pretty easy, and the hard part is getting a stencil. Using this software and printing on overheads as you suggest, makes an easy way to get a stencil.. I will have to try this myself.

Source record: 47328

Collecting information about receiver technique to use on my web site,
but I haven't found any proof when product detectors were used for the
first time.
A note in QST 1950 mentions the application of 6BE6, but it should
indicate that older types like 6K8 or 6SA7 has already been used.
Some early German application uses ACH1 (triode hexode)

Have QST on CD, but only the period 1950-1959 and few loose magazines
for the period 1947-1952, so I would be grateful if somebody could
send me a circuit diagram or article from before 1950 as gif file to
be used on my planned website on www.noding.com

As you have already discovered, with only two crystals the unwanted responses
can be problematic; with four you didn't see the problem.

More later,

Hi Again J-N,

I would guess that the place to go would be to an archive of Western Electric as they are the ones that came up with sideband in the 1920's. Have you tried a web search on this?

Jan:

It all depends upon your definition of "product detector".

My definition is that a product detector is a device whose output contains at least one componen that represents the "product" (i.e. the multiplication) of the incoming signal and a locally generated carrier. This is a functional definition, of what a product detector does, not how it does it.

If you use the above definition, product detectors are probably very very very old... i.e. even a diode pumped with a local BFO fills the bill.

>

I think there are a few other ideas to be thought about in this discussion..

One thing is, the question of how high in frequency the phasing Tx IQ modulator would be working at. If it will be used on the desired Tx frequency directly, then the RF phasing network becomes a concern, particularly if one is trying for more than one ham band.

Another one is, will the same piece of equipment be used as a basis for a transciever.

A DSP I/Q phasing type system introduces a few twists on the reasonable dynamic range, and if one converts down to a low enough IF for a DSP system, then mixer spurs and intermods become a larger issue than a single conversion to a high IF crystal filter.

Those same mixer spurs haunt transmitters too, particularly if starting from a low enough frequency for DSP chips to easily run at.

==========

With surplus timebase crystals, I was able to construct three multipole crystal filters and when I cascaded them in an IF strip, I got STEEP filter skirts. The total cost of all three of the filters together was about $15...

And I know darn well that by the time I got done with a good DSP chip, CPU to run it, and for the Rx something like a pair of 16 bit or better A/D chips for dynamic range, I'd be WAY higher in price.

==========

It seems to me that a homebrewer is more likely to be interested in making a transciever, and may perhaps not be easily able to deal with DSP code and so on.

A DSP and an IQ modulator do have a place in the thinking. But as with most engineering, there are good and not so good parts to any approach.

And, I will admit, I come from an analog background. I'm inclined to use easy to understand and proven to work well types of designs.

Well, OK, so I am planning on a DDS based LO chain. Gotta clean up the digital spurs they generate, but I do like the stability.

Peter,

I also thought that maybe Jan-Martin was looking for any "mixer" type of
detector, but then I thought that maybe he wanted the other types of detectors
which are more of the multiplier type such as a single balanced detector.
Those, of course, produce more of the desirable signals and less of the useless
products that you just end up throwing away. There had to be something before
the 7360 type of detector.

Source record: 47335

Looking for the 1544/1548 adaptor cable and box that allows one to transcieve the TR-7 with R-7 and RV-75. Need one more set to just about finish out my Drake 7 line collection.

Thanks for reading the posting.

Evan

Freeware - one program to clear out the main 99
memories in this rig, another to load the
channels with frequencies contained in input
tables. Written in Q-Basic, QB included too.

Read more about it on Jim's web pages.
Follow links in the amateur radio section.
Top page:

http://home.earthlink.net/~jcswaters

Oh - my dog SmoKee has her own page here too.

Other items on my pages:
link to the office contact, MO and KS repeater
pages, a couple of kid-stories, blank log
book forms, "logbook page" of my QSOs.

Enjoy

Just measure the inductance of windings at a low frequency. Accuracy doesn't matter. The 455 xfmrs have much greater inductance.

Source record: 47341
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hi,
Is there anyone in the Washington, DC metro area who is good at fixing Alpha 374A's? I'm willing to go as far south as Richmond and as far north as Baltimore. A good friend of mine has a 374A that needs to be looked at. As soon as you hit the SSB switch, the TR relay chatters loud enough to wake the neighbors and the fuse blows. With the CW switch in, the unit will come on but the meter lights will switch to the transmit color after 3 or 4 minutes. We found a burned resistor and two diodes that seem to be allowing current to flow both ways on the power supply board. If you know what the problem is or have any suggestions as to how to fix it please pass them along. Otherwise, the name of someone who is good at fixing amps would be greatly appreciated.
Thanks,
Mike

You certainly can. Fancy (and expensive) antennas aren't very good and don't have any secrets in them, regardless of advertising hype.

A good antenna has to be large and installed in a clear, high place. No shortcuts work.

350. Overtone Crystal Filters

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-13 18:34:50 UTC
From: Jim Weir <jim@rst-engr.com>
Message-ID: <u43kqa6tfuc741@corp.supernews.com>
Source record: 47342

I have read with great interest the subject of crystal filters currently going on in this ng, and have a collection of most of Hayward's papers and a few others.

What most of them are fairly silent on is how to design and build VHF (30-80 MHz.) crystal filters using 3rd or 5th overtone crystals. What is even more silent (and hence a bit scary) is that there are no REPORTS of people successfully building narrow to moderate bandwidth (5 to 20 kHz. bw) filters using overtone crystals.

Is there anybody that has a pointer to a good reference or report on overtone crystal filters?

Jim

Sorry, I haven't, Thanks however for chasing me back to Kinsman. I found something there well worth review.

It strikes me that there was something on overtone filters either in Microwave or in RF design in the last 24 months.

IF transformers are quite easy to identify with a Q-meter or similar,
but the problem is all the different RF coils which looks like IF
coils, and you never find any references in price lists

I admit to great ignorance on this topic, so forgive me if my suggestion is naive. But wouldn't you just characterize the crystals at their overtone frequencies instead of fundamental frequencies and use the same basic procedure to design the filter?

At VHF, parasitics would play a larger role of course (and this might be a killer), and you might have problems with spurious responses due to the fundamental resonances -- although those should be far enough away that you could deal with them with another simpler filter. Another potential practical problem I see is that the crystal characteristics might be considerably less desirable at the overtones than at the fundamental.

Things are always much more simple before you've actually tried to do them, so undoubtedly I'm neglecting some substantial problems, maybe some show-stopping ones. I'd be interested in learning more about this, so I'm also looking forward to postings from people who've been there.

Some of the filter manufacturers seem to know how to do it, they make
'roofing' filters for up-conversion receivers well into the VHF region. It
would probably be a good idea to see if some overtone crystals could be
characterised at the overtone frequency and then doing some simulation.

Source record: 47352

Harmonics are created any time a current flows through, or a voltage is applied to, a nonlinear circuit, because an applied sine wave (which consists of only one frequency) gets distorted. Any waveshape other than a pure sine wave contains more than one frequency. When the circuit is nonlinear, a sinusoidal voltage will produce a non-sinusoidal current, or a sinusoidal current a non-sinusoidal voltage. Nonlinear, in this case, means anything where the resistance doesn't stay constant for all values of current or voltage (the I vs V curve isn't a straight line). When wires are connected properly, there's direct metal-to-metal contact due either to soldering or to having enough pressure to break through any surface contamination and keep air and moisture from getting between the wires at the point of contact. But when poorly connected, air or moisture gets between the wires, and oxides form. Metal-to-oxide junctions are nonlinear, so can produce harmonics. The explanation of why a metal-to-oxide junction is nonlinear is, to me, complex. If you want to pursue that aspect, I recommend finding a book on solid state physics.

Interestingly, though, an individual is allowed to build up to five "Part 15"-class devices without violating the law, as long as there is a snowball's chance in hell that the device is still Part 15-emissions compliant. Which is entirely possible, considering how underpowered most commercial 2.4 GHz devices seem to be.

An excerpt from the relevant FCC rules:

"ï¿½ 15.23 Home-built devices.

(a) Equipment authorization is not required for devices that are not marketed, are not constructed from a kit, and are built in quantities of five or less for personal use.
(b) It is recognized that the individual builder of home-built equipment may not possess the means to perform the measurements for determining compliance with the regulations. In this case, the builder is expected to employ good engineering practices to meet the specified technical standards to the greatest extent practicable. The provisions of Sec. 15.5 apply to this equipment."

The question is, what constitutes "home-built equipment?" I could argue that by gluing a MMIC amp onto an existing Part 15 transmitter, I've "created home-built equipment," rather than "modified commercial equipment." If that ad-absurdum example doesn't fly, what if I cannibalize the modulator chip from the commercial gear and build my own amp for it? Etc.

362. 160 meter antenna, need suggestions, limited space

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-13 22:59:39 UTC
From: hexter@blazenet.net
Message-ID: <u444arcmcuej61@corp.supernews.com>
Source record: 47354

I have limited space for this 160 meter project. Also, I am interested in an antenna for local ground wave coverage as opposed to sky wave dx use. Is there such a thing as a 160mtr 'mobile vertical' such as the ham stick type antennas? I have heard of the 'snake' antenna, which I understand is nothing more than insulated wire laying on the ground. The intent here is that a few local hams and I want to get some 160m experience using old converted maritine AM units of perhaps 25w output power. Our problem on 80 mtrs seemed to be that we 'skipped' right out over each other. I could get good 5/9 reports from Florida at apprx 1200 miles away, and could barely hear my freinds of only 12 miles away.

Any suggestions? A beam simply isn't practicle, and I doubt I have room for a folded dipole, so I am thinking base loaded vertical here.

363. Re: Overtone Crystal Filters

Source record: 47355

On the basis that all crystals over about 23MHz are probably 'vibrating' on an overtone then I suppose a38 45 and 70 MHz filters must use this mode. I think the concentration on fundamental crystals has be due to the fact that you get narrower bandwidths most easily from the lower frequency crystals. The case for a roofing filter is a particular exception.

If I can remember aright there was a series of experiments done by Jack Hardcastle, G3IIR, reported in RSGB Radcom in the later 1970s or 1980s. I believe one of those considered the use of 35 or 38MHz units in a ladder format. I believe he did just what Roy suggested.
Try QST Nov 1980 as a start which has one of Jack's articles.

I hope that helps a bit. I may be able to find more information if you want to delve further.
Cheers de Alan G3NYK

Wes Hayward, in his June 1995 QEX article, briefly discusses (ladder) overtone crystal filters.

In most of the filters (fundamental and overtone) he discussed, he tunes out the parallel capacitance of the crystal using inductors. This is much as I described doing earlier while measuring crystals when I used a "mathematical" inductor.

I don't believe you could ever build an overtone (ladder) filter without doing this. As he also states, the motional inductance is essentially a constant, therefore, the motional capacitance will be only 1/9 of its fundamental value when the crystal operates at the third overtone. This then complicates the realization of the coupling capacitor values.

I don't know for certain but I would guess that VHF filters are lattice types.

Wes N7WS

If you just glue an MMIC into an existing part 15 transmitter, you're
not using good engineering practices to meet the specified technical
standards. But careful modeling or mathematical analysis to show that
the resulting device is still in compliance would probably be considered
good engineering practice under the circumstances.

Email reply only to Jstoute338@aol.com

I've got some electronics hobby stuff I'm giving away to anybody willing to come get it.

There's two short 19 inch wide instrument cabs, coils, vernier knobs, various cables and connectors, switches, a couple of wire wrap IC panels, Heathkit antenna tuner, power supplies, microphones, a Pioneer FM tuner.

Its too good to just throw out without at least offering it to somebody. If no reply in 2 weeks from 01/13/02 I'll toss it.

This old business of accepting the 300 to 3000 hz bandwidth as the "ideal communications bandwidth" I think is just that. Old. This is a carryover from the old telephone days when it was easier to limit the bandwidth to avoid some of the problems of transmission. Also most SSB rigs suffer some of the same problems. Especially limiting the lower frequencies. The old phasing rigs had problems maintaining a constant phase shift at low frequencies. How to correct for the problem, limit the low frequencies. Filter rigs have some of the same problems with side band suppression at low frequencies. This so called "communications quality audio that most rigs have is really next to awful audio. Especially when some of them are further degraded with limited range microphones. Some of the signals on the air make your ears bleed let alone hardly being intelligible. I think it is time and the technology is available that we can have much better sounding signals and still be well restricted in channel occupied width. There are so many really distorted transmitters on the air from poor audio processing to poor amplifier performance.
DSP seems that it would solve a lot of the common problems.

Gary, I wonder if you have experience with transmitting SSB with carrier. Sounds like you have a connection to Harris. What do they do in the transmitter to keep the distortion down in a common receiver with a diode detector receiving the SSB AM signal. As I am sure you know when you run a significant amount of modulation percentage the distortion gets quite high in this mode. Approaches 25% I believe at 100%

Steve:

Ah... vacuum mulitpliers! Sigh!

What did the world do when the last 7360 was manufactured?

I often thought that one should be able to make a similar kind of solid state device using MOSFET technologies.

i.e. a MOSFET with one source and two drains, and a gate geometry that forces the carriers to switch channels. Probably worth a patent applications don't you think?

Then there are the modern Gilbert multipliers and other such "long tail" semiconductor circuits that work just fine... so don't pine for 7360.

Best,

>> SNIP <<

While I agree that it is an "old business" I think it does fit in the general regulation that amateur radio systems use the minimum practical bandwidth while communicating to avoid interfering with other people.

Which is part of why they dropped AM transmitting and limited FM to 5 kHz...

Now, in real terms, the difference between 300-3K as compared to 10-10K is fairly substantial so I think limiting the upper frequency limit to something like 3K is a good idea since that would allow one or two other people to transmit without interference.

However, reducing the distortion in the signal being transmitted is a completely separate issue and I think it has more to do with equipment being badly designed and misused by audio compressors, driving some stage in non-linearity, and so on.

Well, I did a 50 MHz crystal filter once which worked well enough but it was VERY narrowband. I was stripping some spurs off of a multiplied 5 MHz reference input.

The main thing I recall was I had to use tuned circuits to force the main RF to the overtone mode but beyond that I don't know what it would take to make a reasonable SSB bandwidth.

A lot of the 'roofing' filters I have seen are monolithic filters, with three separate plates on the same quartz crystal, which is 'way beyond anything I'd want to try to build...

Hi,
Just to give another opinion, I don't think you could tell using an inductance meter. All the 455kHz filters I've ever played with had internal resonating caps. I don't think most inductance meters would measure inductance of such an arrangement; certainly not AADE's nice inductance meter, which varies the oscillator frequency in its measuring scheme.

Coming at it from both the Ham perspective and Broadcasting perspective:

KDKA was assigned 360 meters in 1920. As the number of stations grew, the band was expanded to 550-1500 kc. The hams, which were theoretically licensed to 200 meters (1500 kc) and theoretically only 200 meters, had some special licenses which went down to nearly 1350 kcs before the broadcast explosion, but at about the time broadcasting started needing a lot more space, i.e. 1923, the hams discovered short-wave, and ceased to need the longer frequencies. This was all somewhat suggestive, as the Department of Commerce had no real power to regulate frequencies until the Communications Act of 1927 placed such power in the hands of the Federal Radio Commission, the predecessor of the FCC. 1510-1600 was not added until the '30's, after the hams had vacated the frequencies, through an international shift in allocations by a treaty signed in 1927. 540 kc was not added until, I think, the 1947 Atlantic Conference. This would have been about the same time FM was shifted to 88-108 Mcs in the Americas.

So the hams had 1500 and up from 1912 until 1923, when a voluntary band plan gave them several bands, the first of which ran from 1500 to 2000 kcs until 1927, when it changed to 1715 to 2000 kcs. The AM band could not pass 1500 prior to 1927, as the 1912 law assigned 200 meters to Amateur Radio, and law outranks mere regulation. After the 1927 law was passed, the FRC had somewhat more latitude to assign frequencies, and the 200 meter restriction for hams was removed from the law at that time. Between the FRC's reorganization of the radio stations, now that it had the authority to do so, and the Depression, 550 to 1500 was sufficient for a good while. The original purpose of stations in the 1500's was to provide high fidelity sound, and were originally spaced 20 kcs apart. You must remember FM was only a laboratory experiment at the time this was going on.

I've studied this issue from both sides, having read both the League's 50th anniversary publication and 200 Meters and Down (reprint) and having a father who was in broadcasting for a good number of years. I also took broadcasting in college, hoping to follow in my father's footsteps.

In short, the answer was, serendipity. As the broadcasting band needed to expand, the technology became available to move hams into a different area of the spectrum, and to allow the broadcast stations to also broadcast closer together as well, as well as better receivers for those who listened to either group. Hams stumbled onto short-wave purely by accident. The engineers of that day said that anything above 1500 kcs

was totally useless, so no one had experimented much with it until about 1922.

According to short wave listening tests by Radio Finland a few years
ago, in single sideband attenuated carrier (R3E) transmissions, the
carrier could be attenuated by -6 dB, without too much problems for
simple diode detector radios. If the carrier was attenuated by -12 dB,
a receiver with a BFO should be used.

Try an inverted-L. Mine is 30M (100ft) long. The vertical part is
10M, the horizontal part is 20M. A longer wire would be better but
it wouldn't fit in my small garden. You will need a good ground -
I use several radials (random length), 6 earth rods and a buried VW
Diesel engine (for extra torque).

Jim, there was an article by Gï¿½rard Lagier F6EHJ in the French Megahertz magazine (number 223 October 2001) on a practical approach to the design and methodology of producing 36MHz ladder filters. He has developed some 'rules on thumb' for producing Chebyshev and Cohn configurations of SSB and CW filters.

I've read numerous times that a good deal of speech power is in the
lower frequencies, yet very little information. If this is true, then
the average and probably peak power can be reduced significantly,
without any real sacrifice in intelligibility, by limiting the low
frequency response. I've always thought this was one of the main
reasons, if not the main reason, for limiting low frequency response for
communications. If you want to sound pretty, boost that bass. If all you
want to do is communicate the farthest with a given amount of power,
roll it off.

I'll defer to the experts if anyone has a good source of contradictory
information.

A followup to a posting I made a short time ago. . .

From Terman, _Radio Engineering_, Third Edition, p. 738:

"The low modulation frequencies are sometimes reduced in relative amplitude, or entirely eliminated, in radio systems designed to transmit speech where the emphasis is on intelligibility rather than naturalness. Such discrimination against the lower speech frequencies reduces greatly the total audio-frequency energy that must be handled, and so makes it possible to increase the degree of modulation for the more important frequencies. The loss in intelligibility is small, the gain in signal-to-noise ratio considerable."

It should work fine. You will need very good frequency/phase
stability. Frequency modulating a free-running VFO will not
be good enough.

=======
An single xtal oscillator/tx and a not too narrow bandwidth rx (SSB is customary on HF but not essential) is all that's needed for the PC soundcard to perform PSK 31 , The software enables comms over a number of adjacent channels.
Example : DAT20 transceiver from (Sheldon ,MW0ELR) Hands Electronics ,see SPRAT -Spring 2001 ,pages 21 - 25.

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.equipment

In my mobile I am currently running a 102" whip antenna on 10m which works fine. However, I would like to be able to use it on 12m as well. What I would like to do is to homebrew a fixed L/C tuner (pre-tuned for the middle of the 12m band) that I can just switch in when I want to work 12m, and out when I want to work 10m with no knobs to fiddle with. It also needs to handle around 400 watts. I would like to wind my own inductor etc. for it so I would need the coil dimensions, value of C, a schematic to see how this would all go together would also be extremely helpful (this is my first project of this sort). Any assistance anyone can offer is greatly appreciated.

This is pretty much a nobrainer assuming you have an antenna analyzer
like the MFJ259. All you need is one series coil (no capacitor) between
the center wire of the coax and the whip feedpoint. Wind the coil and
test with the analyzer. If the resonant frequency is too low, take turns
off the coil and if the resonant frequency is too high, put turns on the
coil. About 4-5 turns on a two inch diameter coil form should do it.

Wire antennas are cheap, and as such amenable to experimentation.
Ladder line fed loops with a tuner?
Balloon-supported long wires?
What are your constraints? Can you make a really good earth ground?
An AM broadcast tower might have 180 buried copper wire radials 1/4 wavelength long with an additional 180 radials half that length with copper strap in a circle connecting all 360 radials; Or some similar construction.

I'm wishing to replace an existing discrete xtal filter with a KVG9
SSB filter.
the existing filter circuit is shown in the drawing at

www.corn2.freeserve.co.uk\filter.gif

can I just remove everything between the 0.01 caps and fit the KVG
filter between them, or should I add matching as well?, if so what
would you reccomend ?.
your comments appreciated.
Thanks Mike W, G8NXD

=========================
Yes, anywhere between 50 and 300 pF.

To inspect the capacitors it is necessary to remove transformers from
screening cans. But having removed the can, don't bother looking at the
capacitors, just take one look at the coils.

This is a spoof question.

AM is still alive and well and is growing in popularity. The newer format for FM is 2.5 khz deviation.
SSB can be transmitted in even a narrower that 300 to 3000 hz bandwidth but readability suffers even more. What I am saying is that there is better technology available today to have better fidelity and still not be broad banded.

I agree with what you say. However many of the rigs carry it to extremes to where they sound
awful. In an audio system if clipping is used to increase the average power level the low frequencies must be limited to avoid considerable distortion. However after the clipping circuit there needs to be good low frequency response in order to preserve the clipped audio
and not have overshoot. The high frequencies were normally rolled off to get rid of some of the distortion products produced by the clipping. This of course was done on a lot of the AM
rigs in the past.
With the SSB rigs things get limited by the filters that are used. Limiting the bandwidth does allow for more power in the mid band range but often times at a severe sacrifice in intelligibility. Probably 90% of the conversations on the ham bands are not taking place where you need every ounce of mid band power. I think most rigs could sound much better and still be just as useful.

But there are ways to accomplish these same enhancements these days without the serious band
limiting that has been done.

I overlooked one of the most important things.
Intermodulation products generated in one sideband
also appear in the opposite sideband. Suppose
in USB two test tones are 400 Hz and 900 Hz. One
of the third-order IMD products is at
(1)*(400)-(2)*(900)=-1400
which is in the LSB.

High quality amateur PA's have third order IMD in
the 40 dB-below-PEP range.

This problem involves only the PA and occurs for
any method of SSB generation.

John,

All you may need is a base loading coil for the 12 meter band which should
give you a good enough match to 50 ohm coax.

Download program BOTLOAD from website below in a few seconds.

Program will tell you coil inductance, number of turns of what wire
diameter, to wind on your choice of size and shape of coil former.

If you want an even better match, download program ENDFEED which will tell
you values of coil and capacitor for an L-match. Or a T-match.

To design coils for a given inductance download program SOLNOID2.

Since you mentioned using an old marine radio (2 to 3 mhz) on 160 you might consider using a marine antenna also, there are lots of them out there ,at a reasonable cost,I`m sure..they come in sizes from about 12' to 25' length .You will need a good earth ground, ground rod,fence ,counterpoise,wires on the ground or under the ground...won`t work without GOOD ground..If you use marine 2/3 mhz antenna,just add about a foot to the top whip and check for resonance,you can make it resonance by adjusting length of top whip..good luck Harold W4PQW

A correction (darn it). The third order products
are at -100 Hz (LSB) and 1400 (USB) Hz. The fifth
order products are at -600 (LSB) and 1900 (USB).

This reason for this question is:
I was having a debate with a geophysicist one day.
He basically convinced me that FM although it does skip using the right freq. It tends to scatter as the carrier frequency is deviated therefore a
radio would not be able to decode the message from a skipped signal.
Only AM,CW or SSB is receivable from the skipped signal
Is this true? He did seem to make sense.

That sure did not come up for me.

If the article is not on line, how about summarizing the content for
us, with essential quotes and 'rules of thumb'? Thanks.

From: "Bob Lewis (AA4PB)" <rlewis@staffnet.com>
Message-ID: <u46c7hk6tpuna2@corp.supernews.com>
Source record: 47394

RTTY uses two frequencies and people work skip using it all the time. MFSK16 uses 16 frequencies and people work skip using it on a regular basis. SSTV uses many frequencies just like FM and people work skip with it. I doubt there would be a problem decoding a skip FM signal unless the deviation were much wider than the +/- 5Khz normally used.

Mike,

Try and find the datasheet of the SL612. The KVG filter is about 560 ohms, sometimes a trimmer from either side to ground is advised to improve passband ripple. (if you can sweep it)
Transform the mixers output impedance to 560 ohms e.g. with tapped and tuned inductor.
The 612's input impedance at 9 MHz is about 1650 ohms. Leave the input cap and add a 50 ohms res. in series for stability. Then a 820 ohms resistor to ground. Connect filter output at the resistor node.
Good luck,
Harke
The old Plessey book was never thrown away, you know.

> He basically convinced me that FM although it does skip using the right freq. It tends to scatter as the carrier frequency is deviated therefore a radio would not be able to decode the message from a skipped signal.

He's wrong. You can operate 10 meters FM when the band is open and talk great distances. You do tend to get an exaggeration if you will of the signal fade due to the cliff effect of FM, and you will get some selective fading that will sometimes make the signal unintelligible, but FM skip is certainly possible.

407. FS: Group of 4 Old Radio Books, All for $9

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-14 20:31:17 UTC
From: oldbooks78@aol.com
Message-ID: <20020114153117.11359.00002333@mb-cg.aol.com>
Source record: 47249

I currently have the following 4 radio-related books for sale, available as a group for $9 plus $4.50 postage (media Mail within the US, at cost elsewhere). The books are:

U.S. Naval Training Schools "Basic Radio Notes & Communication Circuits" published in Chicago: Original Wraps. No Jacket. The 147 page softbound book is in good+ condition, clean with no page tears or pen marks other than a previous owners name inside the front cover, and again on the page ends. The covers are a little chipped along the spine, but everything holdong together nicely. Not dated, but looks to be c1950.

Hornung, J.L. "Radio Operating Questions and Answers, 10th Edition" published by McGraw-Hill, 1950. No Jacket. The 588 page hardbound book is in very good condition, clean with no page tears or pen marks, and a strong binding. Blue cloth covers show a bit of wear, but the cloth is not torn, and everything is tight and secure.

Miller, Wayne "Radio Operators' License Manual 1944" published by Ziff-Davis Publishing, 1944 Cloth. No Jacket. The 229 page hardbound book is in very good condition, clean with no page tears or pen marks except for a previous owners name inside the front cover, and a note inside the rear cover. A nice early study guide for obtaining a radio operators license.

Brainerd, Koehler, Reich and Woodruff "Ultra-High-Frequency Techniques" published by Van Nostrand Co. 1942 Good/No Jacket. A WWII era text book on UHF techniques developed by representatives from 40 academic institutions specifically to help prepare engineers in areas needed in support of the war effort. The 570 page hardbound book is only in good condition. An ex-library discard from the Naval Air Systems Command Technical Library Division. A significant amount of wear to the blue cloth covers.

If interested in the 4 books, please email to "Oldbooks78@aol.com" to reserve. Thanks.

Dave

Now that you have put the question in something I can understand I can
give you a beter answer.

While many things hapen to a signal as it goes through the ionosphere
and other methods of propogation, most the time the signal can be
received without any problem. I have worked many stations on the ham
bands around 29 mhz and also around 53 mhz and a few around 146 mhz that
were using FM. Most of the time they sounded the same as stations that
are just a few miles away.

While many times if you look at the pure theory of how things work, it
does not always do that is practice. It could be true (I don' know)
that what he is saying is partly true but it does not effect a signal
enough to be noticed during normal talking. It is just like there is
some distortion in every device an audio signal goes through. There is
just not enough distortion produced to make much differance. To a very
well trained ear it can be detected, but the general public will not
notice it. Sort of like adding a single brick to a truck load. It is
there but not noticable except under very rare conditions.

Quite true. We all know how an airfoil works - top is curved, bottom is flat so air flows slower over the top than the bottom resulting in the formation of a partial vacuum which produces lift. OK, how does a plane fly upside down?

Very well, thank you.

Actually, the angle of attack on a symmetric airfoil (and no, they are NOT curved and flat) is the same no matter which way the pilot's head is oriented. Upside down is a relative term; the airplane has not a clue other than the fact that the oil and fuel need some planning and forethought.

The simple airfoils such as used on beginner model planes are flat on the bottom, but it really doesn't matter as you have pointed out. Fact is, a lot of people will accept the simple explanation, then are puzzled by the inverted question. Here's another for you:

What's the difference between the letters in the top row and the bottom row?

Source record: 47255

OK Jack, I received your crystals and measured them. I certainly should have revisited my Quattro spread sheet before I made my smart remark about low ESR of your crystals. Been working too long on 5 MHz crystals I think.

At any rate, nothing wrong with your measurements, just that the frequency was outside my recent experience.

Crystal fh fl fo df rt rp q
A 13500057 13499748 13499903 309 4.691 3.71 98930.278
B 13500002 13499653 13499828 349 4.691 4.55 78561.608
C 13500109 13499805 13499957 304 4.691 3.7 100709.58
D 13500062 13499735 13499899 327 4.691 4.21 87284.968
E 13500176 13499862 13500019 314 4.691 3.91 94575.125

Those crystals ought to make fine filters. I see the same spurs you described, about 75 KHz above the desired. There's another one as well, at about 125 KHz above the desired. They're not going to make a decent 2 pole because of these, but if you go to 4 or 6 or 8 pole, they ought to yield a filter with under 5 dB IL at your 1 KHz bandwidth and well under 2.5 at SSB bandwidths. There's a nice spread between the resonant frequencies, I had a thousand 9 MHz crystals from Bowmar that were all within a few Hz of each other. If you characterize them, and do a ladder with Haywards X and L software, I'm sure you could hit the required frequencies just by crystal selection without pulling them to the mesh frequency.

Sorry I questioned your measurements, but happy to provide a sanity check, will return the rocks in the next couple of days.

Good question. Many in rec.radio.shortwave say they get better results from
the Select-A-Tenna than, say, the Radio Shack loop. It'd be interesting
if someone took them apart and reported on the differences in design.

You *can* roll your own; there are plans all over the 'net. Just do a web
search.

419. Re: Calibrate A capacitor Standard

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-14 22:36:14 UTC
From: "Clyde R. Shappee" <cshappee@ieee.org>
Message-ID: <3C435D5E.BC86A134@ieee.org>
Source record: 47261

I have:

3-1/2 digit dvm (4000 count)
AC VTVM +/- 2%, mirrored scale, up to 2 MHz frequency
precision oscillator 10Hz to 10MHz
frequency counter
wirewound decade resistors 1 ohm step
various resistor standards 50 ohm to 10k good to 0.05%, several 10k, several 1k. I believe them
to be ok.
time

The capacitor standard is marked 0.01 uF +/- 0.25 percent.

I'd like to know if it is within 0.5 percent, or measure with what I have as best I can. I don't think with my DVM I can do any better than that.

The DVM measures capacitance, and measures this standard at 0.012 uF and I have never trusted
it. This is 20 percent off!

When I put the capacitor standard in my bridge, which is good to 1% it lands on 0.01 uF on the
nose. It is an old bridge, but I have no reason to not believe it.

I have tried putting a 10 k resistor in series, and adjust an applied frequency until the voltage drop across the resistor = voltage drop across the capacitor. I used 4.000 V total. Then calculate the based on frequency what the capacitor is, believing the reactance of the capacitor is equal to the resistance.

I get a value that is even worse than the DVM if I remember correctly. I will have to redo the
test.

Exactly so. Someone in the 19th century "proved" that a bumblebee
couldn't fly. According to his model, that is. His model assumed
that the bumblebee's wings were stationary.

Others have since noted that a bumblebee _does_ fly, and that a
bumblebee's wings move.

> learned gentlemen had any experience of this?
>

By coincidence, I'm doing the exact same thing for a DC-daylight receiver LO, and with your AD9854 board, no less. :)

The PLL reference clock in my design is:

- AD9854 clocked at 100 MHz, output center frequency 10.7 MHz
- 180 kHz ceramic FM IF filter bracketed by MCL T6-1 matching xfrmrs
- MAR-6 MMIC amp to get the level back up to 0 dBm
- MCL PLP-10.7 low-pass filter to clean up high-order overtones passed by the ceramic filter

The phase detector will be an Analog Devices ADF4112 (ordered via Analog's direct-sales web site but not received yet). This is essentially a copy of the NatSemi PLLatinum chip with a programmable prescaler and more charge-pump gain.

My VCO is a Mini-Circuits ROS-2150VW, driven from the 5V phase detector chip with a third-order loop filter based on an OP27 low-noise opamp. The ROS-2150VW is a nice part -- it's about US $30, and gives a full octave of coverage between 1.0 and 2.0 GHz. Phase noise is -96 dBc at 10 kHz, which is actually pretty respectable for a beast of this nature.

Using a DDS with a narrow BPF as a PLL reference is absolutely the way to go, IMHO. The fixed BPF essentially acts like a very high-Q tracking filter. It allows the DDS to do what it's good at -- provide stable signals with a high degree of frequency precision -- while avoiding the sea of spectral garbage you usually get when you use a DDS as a PLL reference external to the loop.

My current plan is to run the ADF4112's R counter at 3X, yielding a comparison frequency (Fcomp) of around 3.57 MHz. The synthesizer is required to cover the 1-2 GHz octave in full, so the N modulus will range from 280 to 560. The DDS tuning range will be about 38 kHz (Fcomp / Nmin * R).

So far, I've tested the general idea with a Qualcomm Q2334 DDS driving a NatSemi LMX2326 PLLatinum chip through a 25 kHz-wide 11.5 MHz crystal filter (N=1043 at 1 GHz, R=12). The results have been really, really

promising. With a narrow loop BW (1.5 kHz-3 kHz in most of my tests to date), the output at the Mini-Circuits VCO is the expected -96 dBc at 10 Khz, which is already good enough for the adjacent-channel rejection I'm after. And there's not a spur in sight. I looked at about 100 randomly-chosen frequencies between 1 and 2 GHz, and the output spectrum remained essentially identical at each of them.

The 1 GHz plot is at http://209.95.122.40/jm/TRACE.GIF -- the outer plot is the LMX2326-based synthesizer, and the inner plot is from an HP8662A to mark the analyzer's own phase-noise floor.

The LMX2326's prescaler is hardwired to 32X, so its minimum N modulus is 992. With the Analog part, I'll be able to reduce Nmin to 280 for almost 11 dB less noise. I'm thinking I can afford to widen the loop BW quite a bit with the new chip, and if so, I'm pretty sure it will be possible to get the performance of the final design close to my analyzer's own limits. I'm already within 6-7 dB of matching the performance of the synthesizer in my Icom R7000, which is a very complex multiloop dual-VCO beast.

This is more than you wanted to know, probably, but if it helps you decide to use the narrowband-DDS-as-reference topology, it might be worth it. I've been really impressed with the simplicity, economy, and flexibility of this approach. It's hard to imagine doing it any other way... there just doesn't seem to be a downside.

424. Re: Crystal Filter Question

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-15 01:44:33 UTC
From: Jack Smith <jsmith@mnsinc.com>
Message-ID: <lh174ugvb6tb1bmrdo0uoga5pop572844t@4ax.com>
Source record: 47267

Harold:

thanks--its always good to have a second view on things and this is my first attempt at a crystal filter. Please add the crystals to your junkbox--no need to return them. They probably cost me around 10 cents each.

Just as you say, these crystals show three resonances; the desired 13.500 KHz, and two above it. In the 2 crystal filter that I built, however, I only saw a response due to the ones at +75 KHz. Apparently the ones around +125 KHz didn't align, but that was hapenstance, not design.

I don't know if you saw it or not, but I did post some Rs measurements versus drive. At the lowest drive levels, around -50 dBm, Rs increased to over 40 ohms. It was in the 4 - 5 ohm range over a fairly wide range, and then started to climb again at +10 dBm or more. In a typical filter, signal levels would usually be well below -50 dBm, so designing with a higher Rs would make some sense. I assume your measurements must have been made with drive somewhere between -30 dBm and +10 dBm.

Thanks again for the measurements.

I was poking around the internet and found an interesting 292-page
crystal tutorial at:

http://www.corningfrequency.com/catalog/vig/vig-tutorial.pdf

In particular, page 3-6 has a graphic that shows spurious crystal
frequencies coupled with X-ray topographs showing the actual resonance
modes for some of the major spurs.

Perhaps more than anyone wants to know, but quite interesting.

Strictly as Bob said it, I agree completely. That is, if theory doesn't agree with how something actually works, the theory is wrong, incomplete, or otherwise inadequate. But we do have to be careful to distinguish between how something actually works and how it appears to work. I remember from my technician days that careless measurements would often seemingly refute Ohm's or Kirchoff's laws, and that a surprising number of technicians were ready to abandon these laws on the basis of the bum measurements. Likewise, there are a bunch of imaginative antenna marketeers out there who measure impossible gains in their back yards, and invent new antenna theory to explain it. (I publicly offered to one of them to pay the cost of a professionally done test at a certified site if the test showed that the antenna met the claims he was making for it. Do you suppose he accepted?)

Although plenty of theory has been proved wrong over the years, it's not every day that principles which have stood for a hundred years are overturned. And it's even more rare for them to be overturned (these days) by back yard tinkerers. So when established theory doesn't match the measurements, first make sure you're applying the theory correctly. Then be damned certain of your measurements before you even think about abandoning the theory. Then if you're really certain that your measurements are good and they refute established theory, dust off the word processor, write a paper, and get ready for fame and recognition.

It's a whole lot easier to tell that a bumblebee can fly than it is to tell what the gain of an antenna is.

Message-ID: <3200347.0201141954.258c26e0@posting.google.com>
Source record: 47269

Hi Clyde,

(Also answered in email in a bit more detail...)

Given what you have to work with, I'd be very inclined to use the cap
in a frequency-selective bridge circuit, such as a Wien bridge or a
twin-T notch filter. For the Wien bridge, for example, you'd use your
existing bridge to make a second capacitor with "exactly" the same
capacitance as your standard; then use some of your 10k, 0.05%
resistors to complete the bridge (assuming they are low
inductance...or calibrate some small metal-film R's), and measure the
null frequency. Lessee...10kohms and 0.01uF should get you about
1591.5Hz, which should be measurable to within the resistor accuracy
given what you have to work with.

A twin-T lets you have both source and detector share a common ground,
but takes three caps (one twice the capacitance of the other two is
convenient).

Or...get someone to measure it for you. :-)

Cheers,
Tom

hey, I had a radio station engineer tell me once that if a two element VHF
dB Products antenna had a gain of 3 db, then a 4 element would have 12 dB
and an eight element would have a gain of 48 dB.............

man was he ever disappointed after he spent 1200 bucks on coax,
installation, iso-coupler (hot AM tower) and it didn't work as well as he'd
convinced managemnent that it should.................

Source record: 47276

>If the article is not on line, how about summarizing the content for
>us, with essential quotes and 'rules of thumb'? Thanks.
I was afraid of this ;-)

1. He takes a bag of nominal xtals and tests them in a tuned drain FET osc with the xtal from gate to ground. (BF245, 12turns T37-6 // 6/60pF and 100K gate resistor)
2. He then groups the xtals such that the spread of frequencies is less than 10% of the desired filter BW. e.g. 50Hz for CW and 270Hz for SSB.

3. For a Chebyshev filter @ 36MHz

```
IN -- C6 ---X1---X2---X3---X4---X5---C5---OUT
| | | |
C1 C2 C3 C4
| | | |
---------------------------GND--------------------------
```

For CW BP=500Hz Zi/o 50ohm
C1 and C6 = 70(68p) ;Calc(used)
C2 and C5 = 83(82p)
C3 and C4 = 110(100+10p)
Form factor 6:60dB = ~2.5 Loss=12dB

For SSB BP 2k7, Zi/o 1250ohm (15:3 turns on FT 37-43 torroid core to 50 ohm)
C1 and C6 = 3.3(2.7p)
C2 and C5 = 6.6(6.8p)
C3 and C4 = 8.6(8.2p)
Form factor 6:60dB = ~2.5 Loss=6dB

4. For a Cohn filter C1 to C4 are CW=10pF and SSB=82p (!This looks the wrong way round to me but it is as appears in the text!)
Replace matching C6 and C5 with a torroid for CW and nothing (short!) for SSB.

Rules of thumb (most of which are fairly obvious)
a) For a given frequency the bandwidth is greater for smaller C (increased coupling)
b) The shape factor will be better for a lower xtal frequency.
c) The greater the number of poles the better the shape factor but the attenuation will be higher.
d) The closer the frequency matching the better the attenuation and the out of band spurii will be lower.
For other frequencies:-
e) Build a Cohn filter starting with 100p for CW and 20p for SSB

f) Measure the passband (ignoring the ripple) and adjust the Cs
g) Stick a variable series R (500) in series with the I and O and vary
the resistance until the best ripple is obtained.
h) Tweek the Cs to get the desired passband and repeat f and g until
you're close enough.

I haven't done F6EHJ justice as it's a really practical article and
looses a lot in this precis. Legalities apart, I have not got a scanner!

Ham Radio University 2002/ARRL New York City-Long Island Section Convention

Ham Radio University 2002 for Long Island

North Babylon, New York - On Sunday, January 20, 2002 at 8AM, the doors of the Babylon Town Hall Annex on Phelps Lane will open for the third annual Ham Radio University. Ham Radio University 2002 is a day of education about Amateur Radio.

This year the forums have been expanded and new forums have been added. There will be twenty, one-hour presentations with special forums geared to the non-ham as well as the experienced ham radio operator. The focus will be "hands on" with many demonstrations.

Come join us at the Babylon Town Hall Annex, Phelps Lane, North Babylon, Long Island, and learn about everything from satellite communications, low power operating using radios as small as a tuna tin, how to put up an emergency antenna, the latest information on advanced digital communications, finding and fixing radio frequency interference problems to purchasing your first station equipment or handi-talkie and a special "Ask the Experts" forum. There will also be a Special Event Station W2V set up and operational on HF. There will live SSTV pictures uploaded to the NLI WWW during the event.

HRU 2002 is sponsored by the Great South Bay ARC and is a cooperative effort between over twenty clubs and organizations in the New York City- Long Island area. It is also the American Radio Relay League, New York City-Long Island Section Convention. Besides the forums, there will be tables set up with information about the different groups, ham radio classes, exam session schedules, public service and other activities.

Join us for a day of fun and education for the whole family!
Admission is open to all - donation is $2 per person.
(complimentary refreshments available)

For more information contact:
Phil Lewis N2MUN, Chairman, n2mun@arrl.net or call 631-226-0698
George Tranos N2GA, ARRL NLI Section Manager, n2ga@arrl.org or call 631-286-7562

You complicate the project considerably by your requirement to switch the netork in and out without leaving the drivers seat (if I understand correctly). For base station use a homemade trap would serve this purpose well, but would be unwieldy on a mobile whip.
You can use a ten meter Pro Am whip and change to a longer "stinger" for 12 meters. Or use a 12 meter whip and change to a shorter stinger for 10. You can use some older CB antennas and rewind them to use on the higher HF ham bands. I once did this for 17 meters and worked all over the world with an Icom 735 running 50 watts mobile.

I have a friend Charles (KB9VRX) who was just telling me last week that he was playing around with his new/used Icom radio on 10 meter and was talking to a fellow who was mobile in Georgia, using a 10 meter repeater in the Boston Mass area.

I take it you've never heard of NBFM activities on 29.6 MHz?

The answer to the question I think you're asking is yes, you can detect a NBFM signal that has skipped off the ionosphere. Like AM, however, it can suffer from the effects of selective fading. In other words, it won't always be intelligible. This is hardly any different than detecting a skipping AM signal.

I think that's the answer you're seeking.

> work.

There's another dimension we ought not to forget. Frequently the experts, and I would suggest especially experts from academia, don't understand the theory, or it's adequacy, nearly as well as they appear to. We used to have an old saying, "an expert is someone 25 miles from home."

Frequently, we amateurs understand the reality a lot better than the theoreticians. Propagation is only partly understood anyway. Yes, experienced hams can predict propagation a lot better than meteoroligists can predict the weather, but that doesn't mean that we understand what is happening. Only that we have a model that works reasonably well.

We still talk about "skip". Strictly speaking, your professor is right, FM doesn't skip, but then, neither do CW, SSB, etc. Skip is a model we hams use that reasonably well explains what we see. it has been known for some time that isn't what happens, heck, read the Handbook, its not a big secret. But that's OK, for our purposes, the model is accurate enough.

But as KB9TMP mentioned, run the experiment. Listen to the 10 meter FM segment, especially on spring afternoons. Then explain how FM doesn't "skip".

VINTAGE METERS

Old Hallicrafters-style (like is on the SX-28) illuminated
milliammeters. Have internal pilot light installed in rear to
illuminate translucent scale with reddish-orange glow.

3" x 3" square bakelite case. Requires 2-3/4" panel hole.

All have lugs and 5000mfd mica bypass. As removed from a late
1930's or early 1940's 1KW AM/CW HF transmitter. Some could use
cleaning. Zero-set screws work. Movements free when rocked.
Deflection when tested using ohmmeter. Digital pictures
available. All are mfd by Triplett.

Model: Range: Price: Remarks:

321A 0-500madc $10.00 Missing pilot light fixture and
minor crack in face.
327A 0-150madc $15.00
321A 0-150madc $15.00
327A 0-300madc $15.00
327A 0-75 madc $15.00
0-200madc $ 8.00 Can't get apart, missing the
pilot light socket.

Walter Treftz (N4GL) --- penguino@atlantic.net ---

At first, I thought I couldn't come up with anything earlier. But
Don Stoner, in his "New Sideband Handbook" which came out in 1958,
says that Murray Crosby "invented the product detector". But
he doesn't mention a date.

Later in the book, it has a schematic for a phasing adaptor. Since
the associated text mentions such a thing being originally described
by Norgaard in the GE Ham News for July/August 1951, and then a more
commercial version was introduced as the Central Electronics Model A
"Slicer", it's not clear which the schematic comes from (or if it's
a newer design). But it just uses a 6AL5 diode for each channel,
as the mixer to translate the sideband down to audio.

In the ARRL's "Single Sideband for the Radio Amateur" (a collection of
articles from QST), first edition that came out in 1954, there's
an article by O.G. Villard, "Demodulation and Selectivity in SSB
Reception". It says the article is "from" an article in QST
for April 1948. There's no mention of "product detector" but
he does talk about frequency conversion for SSB (and, points out
why it would help for straight AM, I guess paving the way for
synchronous detectiion). There is a circuit, just a balanced mixer,
using two 6L7's. He does mention the stuff about turning down the
gain in an old receiver, or to the same effect, making the BFO stronger.
Certainly, that is mixing; there are all those old 432 and 1296 MHz
converters that fed the antenna into a single diode mixer.

I turn the page, and there is a circuit labelled "The Product Detector". The blurb says "Here is a useful detector for SSB reception, devised by Murray Crosby, W2CSY. It gets its name from its operation -- the output signal is proportional to the "product" of signals in two channels". The book says this is from an article "An All-purpose Super Selective IF Amplifier" in QST for March 1953. If that's the article I think it is, it is an intriguing scheme. Anyway, it uses three triodes, from 1.5 12AU7's.

Right under this, there is a passage that looks like it is new writing for the book:

" 'Product vs Envelope Detectors'
The interesting and significant thing about a product detector is that there is no output with the BFO turned off. Unlike an envelope detector, where two or more signals coming in will give a beat or beats, the product detector requires that the BFO voltage be present. Thus it is very similar to a mixer or converter stage, which also gives no output unless oscillator voltage is applied.

The advantage of the product detector is consequently that the output voltage consists solely of beats with the BFO and not cross-modulation beats between signals."

Later in the book, there is an article by Norgaard, which is "from 'Practical Single Sideband Reception' in QST for July 1948". This is about using phasing for SSB reception, and he again uses 6AL5's for the mixers, making sure the BFO is strong enough.

Maybe that helps? I don't have a scanner. I do wonder what was used in commercial circuits, especially since SSB was being used by AT&T long before it became common in ham radio. I do remember reading that the ring modulator came out of telephone use, though I can't remember where I would have read that. But I have no idea whether they were used at the receiving end.

Source record: 47291

Michael,

The original poster needed a 19 kHz crystal, which forms an oscillator at that frequency. My
suggestion was to use the 38 MHz crystal in an overtone oscillator, and divide that down to 19 kHz. If you divide 38.00053 MHz by 2000 you are within 0.265 Hz. The oscillator would easily adjust to the 1 Hz spec the poster was trying to reach.

I don't believe the original poster ever responded with what he was going to do....

Someone out there is going to laugh at me, but at my age, I don't care. If you have a 10mtr whip already, is it not possible to get one of the old telescoping whips for a CB portable, lash it to the top of the whip and then extend it when you want to operate at 12mtrs? I know this sounds like real "amateur radio", but what the heck, that's the way the hobby goes. :-)

BTW, for the purest, let's not worry about a return loss of 10 db versus 14 at the desired freq. Let's get on the air! Keep that Poynting vector pointing in the right direction. E X H, rah, rah, rah! :-)

but no reason for us not to discuss the matter if you find it
interesting. Some collectors just need the original instrument, it is
a bad investment to buy a modified piece,

But since I never worried about such limitations I would suggest an
xtal oscillator in the 1-5MHz region and divide down to 19kHz using
binary counters like CD4060, don't bother that he has spares, this is
our technical discussion

As already mentioned, the power transformer is useable, but it is necessary to punch out the extra laminations (shunts) between the primary and HV windings. And don't try lifing the grounded end of the HV winding and using it into a bridge rectifier without some careful testing. The insulation at that end is not meant to withstand several thousand volts DC.

There is a useable diode. I am using two of them in a homebrew power supply for my Collins 32S-3.

There are probably some fans and motors also. I used a microwave oven fan/motor to replace a 40+ year old fan with noisy bearings in my Johnson Thunderbolt. The new fan is quieter and moves a lot more air, thanks to the high tech plastic blades, compared to the old stamped aluminum ones.

Of course, these ideas depend on whether or not these parts were damaged when the fire happened.

Hi Reticulum,
I would salvage:
1/ the HV transformer (often wanted for tube PA's etc.);
2/ microswitches;
3/ the motor with the revolving mechanism;
4/ the complete control microcomputer with keyboard and display if there is any;
5/ the timer if there is any;
6/ a cooling fan if there is any.

461. Re: 160 meter antenna, need suggestions, limited space

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-16 13:03:27 UTC
From: Richard Hosking <zaprichardh@iinet.net.au>
Message-ID: <3c457976$0$1776@echo-01.iinet.net.au>
Source record: 47203

We did 160M AM years ago in VK3
Most people used vertical antennas or a long wire which was effectively a top loaded vertical antenna.
Ground wave radiation was better with the vertical in theory at least. In practice it was difficult to get a half wave dipole far enough up to get it operate properly. To get a radiation resistance approaching 50-70 ohms you have to get it a good half wave above ground.
The problem with a short vertical is that it has a very low radiation resistance in the order of a few ohms. The ground connection typically has a resistance of 20-30 ohms for a large number of buried radials (say 20-30 1/4 wave radials). This means the antenna efficiency is only 5-10% as most of the power is dissipated in the ground resistance. You can increase radiation resistance by top loading the antenna (say a capacity hat) which makes it look electrically longer at the feedpoint. This also makes the current distribution in the antenna more equal
The simplest scheme is to get the longest, highest wire up you can and feed it against the best ground you can. You will have to probably step 50 ohms down to a lower impedance, depending on ground resistance plus radiation resistance and load the antenna out to a quarter wave.
A good book on the subject is

Low band DXing

We achieved 55-60dB sideband suppression using the polyphase network and a Johnson Ring counter arrangement for the RF quadrature generator up to about 10 MHz. Admittedly this was trimmed for best result and drift may have been a problem in the long term.(See Electronics and Wireless World Jan 1996) Using proper pole frequency selection you could get quite good accuracy from 100Hz to about 8 KHz and the network is quite tolerant of error (in fact I inadvertedly shorted or open circuited components on occasion without major loss of performance.)
The problems were component count and in band losses (while out of band signals were attenuated much less)

Source record: 47205

Slightly off topic, but I was curious if any other homebrewers or professionals have this pet peeve....

I was hooking up an expensive GasFET LNA (20 GHz, 40 dB gain, 4 dB noise figure)the other day, so I could work on my noise figure algorithm. (Part of my job is to design signal processing algorithms for RF measurements on a computer.) Well, something wasn't working right so I went and checked the power supply. I had the leads reversed. Fortunately the amplifier has some sort of protection built in.

The power supply has some bananna jacks, the main part being some generic color that looks nice but serves no useful purpose. The base mounting rings are smaller than on most bananna jacks I have seen. There are three, for + - and chassis ground. There are tiny + and - marks next to the + and - jacks, but the panel is a bit crowded and they are hard to see, particulary with bifocals.

Another guy looked at them (the bananna jacks) for me and said that the bases of the jacks are red, green, and gray (for + ground and -). I never noticed because, to me, they have very poor color contrast. When he pointed it out I said they looked green, greener, and (a rather poor excuse for) gray.

Now, lets say that a conservative 90% of EEs and techs are male. Of these a conservative 10% will have a problem with colors like I have (not completely, just certain shades of red and green). That makes at least 9% of EEs and techs. Knowing this, why can't companys use colors that are easier for us to see? I can certainly see some reds and greens.

Same thing applies to resistor colors. The good ole EIA colors they used back in the 60's and 70's I have no problem with, but the newer imported carbon films use different shades, and I always have to verify them with an ohmmeter.

Same thing applies to flying. I can't fly at night because the colors of lights they use (red and green) I can't see. Green looks like washed out blueish-pink to me.

Can anyone please help with any good leads on where to find a table of transmission or blocking properties, (attenuation :vs: freq?), for typical engineering polymers and coatings for polymers (conductive EMC shield paints?).
I'm particulary interested in the 2GHz-7GHz range.
Many thanks in advance,
JB

please excuse the cross-post

Good advice and I might add my experience. I had a vertical that performed
poorly
and some kind soul advised that I should lower the resonant frequency (top
loaded)
and cancel the reactance at the feed point with a capacitor. That raised the
feed point
to 200 Ohms. I then used a transformer (tapped coil) to get 50 Ohms for the
transmission
line.

The result was much better signal reports.

Yes, I do.

I sometimes cannot read brown from red on a resistor, and it was only a little while ago that I realized all 1% resistors have a brown band for the tolerance. I can certainly tell a red light from a green light in traffic, but red and green lights on airplanes forget it.

My step mother sent me gold toe sox for Christmas. It is cruel. Three pair, black, blue, and brown. I can match them up, but have a hard time particularly with the black and blue.

You are not alone.

When I was a child, I'd ask my mother what color something was, and she'd reply, "oh, that's plain color".

Now I understand.

Hi,
Luckily for me, I have no problems identifying colors in the lab or elsewhere, though the imported resistor colors are often impossible to tell if it's a red or brown, as you say.
We had an EE in my lab some years ago who was completely colorblind. His wife used to dress him, and he'd usually wear the same jacket all the time. He was a brilliant engineer, but would never do his own breadboarding due to not being able to tell colors. I never knew he was colorblind until one day I asked him why he never did any breadboarding, as all the other engineers also worked on the bench--and that's when I found out.
I can surely sympathize with you, though!

Hi Jim,

I'm not colorblind at all, yet I have trouble reading the pastel
colors that some modern components are marked with, especially
resistors. I often have to use an Ohmmeter to check them.

472. High Voltage Arcing???

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-16 20:18:28 UTC
From: Edward2001 <Edward2001@peoplepc.com>
Message-ID: <3C45E014.D8094A7E@peoplepc.com>
Source record: 47226

We have a problem (when we are burning in some high voltage tubes), with the anode arcing over to the filament. The anode is being run at 60 Kilovolts, with a current of 5 milliamps. The filament is being run by a transformer, through some relay contacts. The arcing plays havoc with the relay contacts, and some other circuitry. I would like to short out these high voltage spikes, before they get to the relay contacts. Would a varistor be capable of handling this kind of spike? Is there a better way to do this? Are all 300 watts, being fed back to the relay contacts, or is much of it being dissipated by the tube? Any help or input would be appreciated.
Thanks in advance,
Brian

I've got a problem with red-orange-green perception, and find that I do all right outside in the sunlight, but under florescent lights it's time for the meter.

This goes for both resistors and wires (and valve body springs in transmission shift kits, but that's another story).

When I worked for EMI music, someone decided it would be a good idea to color-code the cabling for the four audio channels going into the cassette tape duplicators.....yup, they chose red, orange, green, and brown.

Last I checked, there was a wide variety of formulations and materials available, and I'd hesitate to accept any "typical" values.

A Google web search of "EMI coatings" gave about 80 hits, mostly coating manufacturers. Any of these should be able to furnish detailed information about their products, and you'll probably find quite a bit on their web pages.

If you're interested in absorptive coatings, see Emerson & Cuming's offerings at http://www.eccosorb.com.

Message-ID: <3C460173.429E1211@ieee.org>
Source record: 47217

Hello,

I am looking for a power resistor, 20 W, 8000 ohms. It is tubular, with radial leads. 0.6 inches diameter, about 2.4 inches long. I believe it was manufactured by IRC. It is the cement kind.

I have looked everywhere, Surplus sales, Dans, Ocean State, Debco....

Any clues?

Clyde

KA1CRV

PLS Pardon me if I posted here before. Didn't find it in my sent box....

477. 40metter antenna/tunner.

Well i'm in the process of putting togeter one of the pixxie II Radio for the QRPp-i group and well i need to ad an antenna to the design for 40 meters...The least expensive the better...To throw a big wrench in the project i do not have an antenna tunner... I do have a swr meter though..any suggestions...

478. Searching article abt SSB RX in QST June 41/April 1948

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-16 23:35:28 UTC
From: la8ak.xnd@online.no
Message-ID: <3c460bac.195332710@news.online.no>
Source record: 47219

Searching the following article. Unfortunately I haven't QST CD for
this period, seems to be next choice...

June 1941
J.L.A. McLaughlin "The Selectable Single Sideband Receiving
System" p.16 (50 kHz IF strip with switched second LO
and carrier channel for tuning purposes)
(see also April 1948)(SSB)

I am only interested to see what sort of detector is used, so I might
need only one page, gif or other formate is most useful

I might be interested to see the notes referred to in April 48
J.L.A. McLaughlin "Selectable Single-Sideband Reception
Simplified" p.11(AM 50 kHz IF 3 tube circuit, no BFO,
for AM reception) (SSB)

Villard "Selectivity in SSSC (SSB) Reception" p.19
(balanced mixer)

Grammer "SSSC (SSB) and SSSR" p.29

but again, still wish to see only the application of product detector

Does it have to be an exact (physical) match? Consider 2K/5W
resistors (4 in series) or 8K/5W (4 in series/parallel) if you don't
need an exact replacement. You can get those from DigiKey.

480. Re: 160 meter antenna, need suggestions, limited space

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-16 23:40:42 UTC
From: Richard Hosking <zaprichardh@iinet.net.au>
Message-ID: <3c460ec8$0$4885@echo-01.iinet.net.au>
Source record: 47221

Unless you had a very tall vertical (say a couple of hundred feet), I suspect most of the 200 ohms was ground resistance. With a typical short vertical of 30 feet or so the radiation resistance would be a few ohms (say 5 _- I would have to look up the tables). Assuming the antenna was loaded to resonance and impedance matched correctly, this would give a radiation efficiency of 5/200 or about 2.5% ie most of the power is lost in the ground. Even with a quarter wave vertical (ie around 40 metres high) its theoretical radiation resistance is only 35 ohms. Depending on the type of soil and other local factors, it takes a lot of copper in the ground to get a reasonably efficient ground connection.

In my case the antenna was resonant at about 1.6 to 1.7 MHz. This gave
inductive
reactance at 1.8 MHz. the reactance was canceled using a capacitor.

J-M,
I think I have it here in the 1955 ARRL Handbook...uses 12AU7s as a product detector. I don't have a scanner but if no one else can provide the info, I can take a digital snapshot of that part of the ckt.

Well, an exact match would be Ideal, as it would fit nicely in the
chassis....

If I don't find it, I'll have to resort to some combo, under the chassis
solution.

Doh! I did the same thing with an AD9854 evaluation board a couple of weeks ago. My usual habit of using a CV/CC power supply with the current limit cranked way down saved my bacon on that one. If I had left it at its 10-amp maximum setting, the $300 board (and probably the PC printer port it was connected to) would have been vaporized.

I'm not color-blind at all, but those metal-film resistors with the blue bodies really give me fits. The red, orange, and brown bands, in particular, cannot be distinguished without an optical spectrum analyzer. What are the manufacturers thinking?

```
Junkbox Surplus Parts for Sale as of 01/15/2002
===============================================

Caps
====
NEW .1 uF Poly/Film caps - 10% 250v, new stock, paper tape, nice
long leads. These are not NPO and are made by S&M Components
50/$3.00 or 100/$5.00

NOS .01 uF ceramic caps, 10% 100v brand new by Kyocera
50/$3 or 100/$5

NOS 1000pf blue mono caps, 10% 100
50/$3 or 100/$5

NOS 470pf ceramics on paper tape, rated 5%
50/$3 or 100/$5

NOS 12pf NPO ceramics on tape
50/$4 or 100/$7

22uF 35v electrolytics These caps are on paper tape, NOS (New, but old
stock) made by Richey.
50/$2

Connectors
==========
I have NEW BNC chassis connectors for (includes nut and lock
washer) (I only have a few 100 left)

25 for $14.00
50 for $25.00

Voltage Regulators
==================
L7806CV voltage regulators. TO220 case. 5 for $4.00
LM7812T voltage regulators. TO220 case. 5 for $4.00

Key/Headphone Jacks
===================
These are 3.5mm female stereo PCB mount jacks. Can be used in
ugly/manhattan building projects with no problems.
3/$1.35 (or send a buck and a stamp)

Transistors
===========
TP2222 plastic TO92 NPN - NEW PARTS (House brand 2N2222) - 50/$4.50
```

100/$8.00
2N3906's plastic TO92. PNP - 50/$4.00 NEW PARTS
2N3704's plastic TO92, NPN - 50/$4.00 NEW PARTS
2N7000 MOSFET - 5/$2 10/$3.50

IRF540's TMOS Power FET, N-Channel, 27A, 100v RDS(on) = .070 Ohms
http://www.onsemi.com/pub/Collateral/IRF540-D.PDF for data sheet
$1.00 each.

BC847B - Surface Mount NPN's, general purpose
CBO = 50v, CEO = 45v, EBO = 6v, Collector Current Max = 100 mA,
electrical characteristic curves for this unit are the same as the
PN2222A, SST222A, MMST2222A, and UMT222A transistor. These are new
stock, on SM tape. 100pcs/$3.00 200pc/$5.00

Op AMPS, Comparators
====================

LM741CN - Single Op Amp, 8 Pin Dip, 4 for $1.50
http://www.hep.ph.ic.ac.uk/~hallg/Instrumentation/Data/LM741.pdf

BA4558 - Dual Op Amp, 8 Pin Dip, 4 for $1.50
http://www.rohm.com/products/databook/standard/pdf/ba4558.pdf

BA10324 - Quad Ground Sense Op Amp 14 pin, 4 for $1.50
http://www.flint.co.uk/product/pdfs/FR3LIN.PDF

BA10358 - Dual Ground Sense Op Amp, 8 pin, 4 for $1.50
http://www.flint.co.uk/product/pdfs/FR3LIN.PDF

BA10393 - Dual Comparator 8 pin dip, 4 for $1.50
http://www.flint.co.uk/product/pdfs/FR3LIN.PDF

BA10339 - Quad Comparator 14 pin, 4 for $1.50
http://www.flint.co.uk/product/pdfs/FR3LIN.PDF

BA4560 - Dual High Slew Op Amp, 4 for $1.50
http://www.rohm.com/products/databook/standard/pdf/ba4560.pdf

Crystals
========
3.579545 Mhz Crystals for 80m - These are pulled colorburst crystals,
2/$1

POTS
====
10K 1 Turn Panel mount pots. These are pulls. No knobs, just
shafts. Most are Allen Bradley. Pot is about as big as a quarter.
With nut. 5/$4.00

Diodes
======
1N4148 - You always need these. 75 for $2.00 These are NEW.

Let me know if you're interested. All prices are post paid to the
USA, unless otherwise noted. I will ship to non USA addresses but we
need to discuss the shipping charges first.

Would anyone be interested in surface mount 2N3906's? Let me know.

I cannot help you much with the tuner, but it is likely that the SWR bridge you have (if it is the generic CB type) will not work at sub watt power levels. If you get a forward power reading at all, the reflected power level will look like you usually have a perfect match when in fact you simply do not have enough reflected RF voltage to get the diode to conduct!

Check out the resistive bridge LED based set up at http://www.extremezone.com/~nk7m/n7veswr.htm.

This bridge is capable of indicating down to 5 mW of reflected power. First peak your tuner for maximum receiver noise, then transmit and tune for the LED to go out. The resistive bridge configuration protects the transmitter finals also. Worst case load to the TX is 33 ohms (shorted antenna) to 100 ohms (open antenna).

For the simplest antenna/tuner combination, use a half wave wire (~66 ft for 40m), and use the tuner shown at:

http://www.qsl.net/w0ch/field_antenna.htm

This tuner is designed to match 1/2 wave, end fed antennas. An end fed, half wave antenna is a very effective QRP radiating system. It is very portable as well!

I'm trying to patch together a home-brew HF rig. I want it to cover 80-20M. I was thinking of using a Mini-Circuit MAR-6 MMIC chip for the preamp for a KK7B R2 based receiver. I have heard the noise figure isn't great for this type of preamp.

Hi Brock,

I don't know the exact NF of the mmic, but at the frequencies that you
are describing, I would guess that this would not be critical. There should
be formulae for the sensitivity in the handbooks and you can do a what-if on
Excel or with a simulator using various NF's also just to reassure yourself
that the part will work okay for you.

Good luck.

The noise figure should be under 3 db looking at their specs. This is for a frequency of 500 mhz. For use under 30 mhz I wuld think it would be lower. Even if not it should be plenty low enough for use under 30 mhz. Look at their web site for the full specs. Think it is minicircuits.com

I don't think this is a good idea.

It's true that the noise figure for the MAR-6 is very good, I've measured one at 2.4 dB at 5 MHz. And, its really simple to build a preamp with the MAR series.

But--and it's a big but--the intermodulation and strong signal performance of the MAR-6 is not impressive. The quoted IP3 for the MAR-6 is +14.5 dBm (output) or -6.5 dBm (input). The one I built didn't perform as well as this. And, 20 dB is a lot of gain for a HF receiver, so concern for overloading the receiver is an issue.

Based on the quoted IP3, signals as strong (weak?) as -45 dBm at the antenna input will produce intermod products that are well above the noise level and quite noticeable in your receiver. For reference, I've seen signal levels around -15 dBm on my antennas from shortwave broadcast stations, or AM broadcast stations. And, even a quick and dirty breadboarded MAR-6 has significant gain into hundreds of MHz, so you might even get IM from FM broadcast or even TV stations. So, you are likely to find the bands become a sea of crud from intermodulation products.

If you are looking for a simple broadband preamplifier for the 3-30 MHz range, I would build one with a 2N5109. There's a complicated version of this at

http://www.qrp.pops.net/preamp.htm

but, simplified versions have been published by DeMaw in his books.

Another good low noise figure preamp with excellent IP3 figures can be made from a J310 FET running in grounded gate.

If you are really interested in a 2N5109 or J310 amp, e-mail me and I'll e-mail you a schematic and a photo or two of the ones I built for testing.

We all have our strengths and weaknesses and ought to choose a career that uses most of the strengths and is not hindered by the weaknesses. If I were colour blind I, would always check carefully the polarity by another means before applying power.

Red and green are colours that, to most people, are very different indeed. If you are colour blind, there are some tasks you should not attempt, one of which is visually checking colour coding the other is flying/driving at night.

At resonance the antenna will obviously look like a pure resistance with inductive or capacitive reactance zero.
My point is that this resistance is made up of the resistance of the ground connection plus the radiation resitance of the antenna. For a short vertical this resistance is only a few ohms so that to get a feedpoint load resistance of 200 ohms you must have had a fairly high ground resistance unless you were using some sort of matching arrangement.

Peter
Salt water obviously makes a very good ground connection and also acts as a
good reflector for radiation near the antenna. There was a series of
articles in Amateur Radio by John VK3ACA in the 70s which described the
issues of 160M antennas very well.
I am glad to hear 160M is still active over there.
Is VK3AML still on the air?

Not knowing what kind of circuit you are running this in, hard to tell, OM.
If it is a transmitter,
and the arcing is occurring when the key is released, you might try using a
dpdt relay and con-
necting the other side to ground. This is a wild guess and only comes with
some experiences I
had back in the AM days Probably way off base, but you don't supply enough
info.

The antenna was resonant at some lower frequency, not at 1.8 MHz. The feed
point was not at the low resistance point but was rather offset. It was like
feeding a dipole
at a point offset from the center. I agree that at the normal feed point, up the
tower a ways,
the feed empedance would be very low and resitive.

You ought to be able to get 2.8 dB plus a couple for the front end IL of whatever filter you use. The 19 dB of gain will kill the overload protection that the R-2 has and provide you with a noise figure that is unuseable on 80 thru 20 unless you don't have anything better than a wet string for an antenna.

In the Jan issue of QST there was a fairly good article on DDS with parts list and schematic... also had sorce for circuit board and programed pic to controll dds chip...

506. Re: High Voltage Arcing???

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-17 18:57:16 UTC
From: Edward2001 <Edward2001@peoplepc.com>
Message-ID: <3C471E8C.3DD90777@peoplepc.com>
Source record: 47156

There is a step-up transformer (for the anode) and a step-down transformer (for the filament).

The secondary of the step-up transformer has one lead that goes through a rectifier to the anode of two tubes. The other lead goes to ground.

The step-down transformer has a center tap that goes to ground (through a 4.7K resistor for a meter). The other two leads of the secondary, go to the two leads of the filament, through relay contacts (so we can select one of two different tubes).

The tubes are x-ray tubes, with just an anode and a filament. What we are doing is seasoning the tubes, for the first time. Sometimes, the anode will arc to the filament. Once in a while, when it arcs inside the tube, it will also arc from a connection to the relay contact, to ground. When this happens, it will burn a carbon trace to ground.

It is a very simple circuit, but with this one problem. Any ideas?

I live 1-2 km from various UHF TV and FM transmission sites and nearby
cellular towers. When connecting a short test lead to the input of an
MAR-6 amplifier will make the output more or less useless on any
frequency, due to the huge number of spurious signals. If the MAR-6 is
to be used close to the antenna, quite a lot of selectivity is needed
in front of it (e.g. a tunable preselector). For HF applications, the
input filter must contain some low pass filtering above 30 MHz (with
chip capacitors) to avoid intermodulation products due to VHF/UHF
signals.

For HF applications MAV-11 might be a better choice, with a noise
figure of 3.8 dB (not a big deal with any resonant antenna on HF), the
output IP3 is 30 dBm (15 dB higher than on MAR-6). With 13 dB of gain
and +16 dBm 1 dB output compression point, thus the input compression
point is +3 dBm, compared to -20 dBm for MAR-6.

You may have already bought parts, but myself, I would just use a
center fed 1/2 wave dipole fed with coax. This will be very efficient.
About as good as you can get really. Running qrp, you don't want or
need extra losses from a tuner. Using a 1/2 wave coax fed dipole, you
won't need one. Also you will vastly reduce the likelyhood of common
mode problems by using a center fed dipole rather than an end fed 1/2
wave. The center fed will work better in most cases. I bet 90%..And
the best part is it's very cheap. MK

Jack and Paul are right on the money... forget the MAR-6 for HF use.
The noise figure is no problem, but you don't need 20 dB of gain in
front of the R2 or any other HF receiver. The IMD will cook your goose.

What kind of antenna are you trying to use, and why are you thinking you
need a preamp? The MAV-11 may be a better choice, but if you're trying
to work with an electrically-short antenna, you'll be better off with an
impedance-matching solution like the preamp at
http://www.amrad.org/projects/lf/actant/. Don't mess with the pricy
Crystalonics JFET they recommend... just use an ordinary J310 and run it
on 12 volts. This will work better than any 50-ohm MMIC with a small
antenna.

Paul:

Yes, good points! A MAV-11 would be better. But, you can reach an input IP3 of +33 dBm with 10 dB gain and around 6 dB NF with a 2N5109. If you want to do the "noiseless feedback" trick, you can drop the NF down to the sub-3 dB range, but you have to wind a somewhat complicated transformer. For most HF use, IP3 is much more important than NF.

The MAR series amps are great for many applications, but putting one in the front end of an HF receiver in normal circumstances doesn't strike me as a good idea. The effort you would have to put into filtering would cancel the simplicity of the MAR amplifier approach. Even if you filter out the AM, TV and FM broadcast, how do you filter out the SW broadcast? Even here in on the east coast of the US, it isn't uncommon to see 6 or 7 MHz SW signals in the -15 dBm range at night, if you have a good antenna. I've seen spectrum analyzer plots from Europe that show SW broadcast signals in the 0 dBm and stronger range!

I put my HP 4300 broadband (flat to 20 MHz) true RMS meter onto my log periodic antenna a few weeks ago to see what the total signal intake might be in a receiver front end. I put a 50 ohm termination on the 4300. During the daytime, I was seeing a reasonably steady -20 dBm, with peaks around -15 dBm. (Antenna is a log periodic 7 MHz and 10-30 MHz, at 30 meters above ground, pointed north east from a location near Washington DC.)

I agree with Jack. The most important thing would be the IM, etc due to out of band signals. Your best design would include some healthy front end protestion in the form of a preselector if possible. At least a good band pass filter with a 50db stopband or higher outside the band of interest. This is highly desired if you have metropolitan broadcasters right on your QTH.

Does anyone out there remember the 40mtr preselectors in QST which were made using galvinized garbage cans? Now, that is front end protection! :-)

BTW, I think I'm getting too old, as everyone else thinks that I'm pulling their rip cord with my memories of past projects in the mags. Oh well! Sooner or later I'll be a silent key in 12AX7A/6L6 heaven. :-)

I can't quite place a 40M filter in a garbage can.

On the cover of QST for June 1972, there was a 2 metre filter made out
of a garbage can. Partly it was a joke, but it did work fine. They
even talked about cooking hotdogs inside the cavity.

Within a few years, there was an article in QST about large helical
filters for the HF bands, but I don't remember any garbage cans in
that article.

Some guy did describe a 10M cavity made out of an oil drum in 73
around 1969 or 70. He had some cockamamey (did I spell that right?)
new modulation scheme, and he wanted to strip off a sideband, so he
built a filter with the oil drum (or maybe it was more than one).

If you could provide a time period when you remember seeing such an
article, it might help.

Hewlett-Packard has their newest version of AppCad on their website. It will do cascaded noise figure calculations, as well as many other cool things. The url is www.hp.woodshot.com. This will take you to the download page for AppCad, version 2.5.

I have a good friend who has red-green color blindness and is one of the very best engineers I know. He has some trouble with resistors, but usually manages with 5% values at least if different brands or types aren't mixed. Because of the limited number of possible combinations, there are only a few that are ambiguous, once he gets used to the colors on a particular brand. But he always has to be aware of his handicap, and keeps a meter handy. And he needs to have, and gets, some help when connecting color coded wires or other colored components.

Of the several people with red-green color blindness I know, none have trouble with traffic lights -- they're bright and different enough to distinguish. One friend who flies, though, took a test with light guns to try and get permission to fly at night. He thought he had done pretty well -- until the results came back. He did worse than random guessing by a statistically significant margin.

A young man I know found that because of his color blindness, the only job available to him if he were to join the military was infantry. This I can understand, because of the ubiquitousness of color coding in everything from medicine to hydraulic lines to electrical components, and the necessity of troops to be able to function effectively in much less than idea circumstances. But as my engineer friend has shown, it can be an almost insignificant handicap in electronics if you accept the limitation and learn to deal with it.

The really sad thing is that light guns in tower controlled airports
are almost never used. In an era when battery powered hand-held
aviation radios are inexpensive additions to most pilot's flight bags
this requirement is like asking someone to demonstrate how to saddle
up a horse to drive a car.

Thanks for standing up for us color blind engineers and private
pilots, Roy!

I was in Air Force ROTC as an undergrad, but decided that if they
would not let me be a pilot I didn't want in. (Besides, my draft
number was 362!)

As I said, the old carbon comp resistors with the EIA pigments are no
problem.

I have always wanted to be an engineer. My license plate is N8EE, and
someone once asked me if it meant 'inate engineer'---which is true. I
have never really had very many problems---I just have to be careful.

I have had night training for my pilots license, but after I
'graduated' they clamped down on it. Went and took the color light
test like your friend and the same thing happened---worse than random.

They said I would be wasting my money if I tried again.

Being an engineer/scientist I do find things that are fun and amusing every now and then. I once had a translucent toothbrush that changed colors denpending on if I looked thru it thickwise or thinwise.

No i guess i was lucky enough to call the store ahead of time and fined
they were out of toroids so i decieded to wait on the parts... in the i
guess i am lucky... as far as centerfed halfwave dipole how i saw some
articles on that as well but the required a specific length and type of
coax to get a good match... any ideas on the length and type i would need
for 40 meters?

Hi all,
fortunately, I distinguish colors very well, according to tests better than average. Nevertheless, I sometimes have problems with colour coded resistors. Why ? Due to different background of the coding. I have seen resistors painted gray, light brown, dark red-brown, light blue, dark green and maybe more. All colour-coded, of course. But the perception of the same colour over different backgrounds differs, even when the eyes are in perfect condition. My advice ? Always have your multimeter ready !

I'm red/green deficient, and have always had trouble telling a 1000 ohm resistor from a 1 megohm, and so on. Sometimes I can tell, but I usually don't take the chance, and check it with a meter. On those little 1/10 watt resistors, it's impossible, at least for me.

The classic "book" used for testing color blindness was quite an eye opener for me, I couldn't see ANY numbers beyond the first page. However, there is a "trick" to traffic lights. The red light is always on the top for vertically mounted lights, and on the left for horizontal mounted.

well i have been totally color blind since the age of 7. through the
years
i have learned to work with colors via shades of gray, the small color
bands on resistors do cause some problems so i am forced to use a
ohmmeter on these other wise if the colors are bright such as hook up
wire i have no problems, however i can only tell the basic colors, for
me their is no sky-blue or ocean blue its blue period via the shade i
see.
the real plus to this condition for me is the ability in my present job
to work in light levels where most other wire men are blind and need
lots of light.I guess every cloud has a silver lining. the reason i lost
my color vision was due to looking at a solar event back in the early
60's without proper protection. just in case anyone wants to know, no i
cannot watch a b/w tv and tell you the colors does not work that way.
I also was able to fool the doctors at the military induction center
into thinking i could see colors.

Do those red and green turn arrows present any problem? Just curious.
They're often hung up all by themselves.

Even when they're hung all by themselves, the standard is
red on top (vertical) or on the left (horizontal).

One of the good things about working for a state highway department
is that one gets copies of various standards books.

That was the point, at night, you don't know what is top or left. They ought to flash them or something.

As for the book, it is interesting, there are some pages where you can see more than one number if you look carefully. Is there an electronic version available anywhere?

Also, while on the subject of colour vision. Does everyone have the same spectral range? I.e. Where does red stop being red and become infra-red and is it the same for everyone?

I wonder how old the idea is. I had a friend who used it about 30
years ago, but it may be quite a bit older than that. (I find it
faster to just fab a board...if it's a quick job, I'll toss down the
traces that are obvious and do the rest with wire. Also lets me
handle a much wider range of components.)

Cheers,
Tom

AMATEUR RADIO NEWSLINE(tm) REPORT #1275 - January 18 2002

Amateur Radio Newsline report number 1275 with a release date of
Friday, January 18th 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T. A new ham antenna on the I-S-S and a new microwave record down-under are first on Amateur Radio Newsline report number 1275 coming your way right now!

(Billboard Cart Here)

**

HAM RADIO IN SPACE: NEW ANTENNAS INSTALLED ON THE ISS

An American astronaut and a Russian cosmonaut ventured into space on Monday January 14th to move a construction crane and install a new set of ham radio antennas on the International Space Station. Roy Neal, K6DUE, has the details.

--

THERE IT WAS, ON NASA TELEVISION, TWO WHITE SPACE SUITED CHARACTERS, DWARFED BY THE IMMENSITY OF THE INTERNATIONAL SPACE STATION. FOR THE 32ND TIME ASTRONAUTS AND COSMONAUTS WERE OUTSIDE THE HUGE SPACECRAFT TO ASSEMBLE HARDWARE.

THEIR PRIMARY OBJECTIVE WAS TO MOVE A BIG CARGO CRANE FROM ITS TEMPORARY BERTH ON THE UNITED STATES SIDE OF THE ORBITING OUTPOST TO A PERMANENT LOCATION OUTSIDE THE DOCKING COMPARTMENT OF THE RUSSIAN CONTROL MODULE.

THAT ACCOMPLISHED, THEY WENT ON TO UNFURL A HAM RADIO ANTENNA. ASTRONAUT CARL WALTZ, KC5TIE AND COSMONAUT YURI ONUFRIENKO, RK3DUO, DEPLOYED THE RIBBON OF TAPE THAT SOON WILL BE IN USE ON A HAM RADIO STATION IN THE SERVICE MODULE,. WHERE THE CREWS LIVE AND SLEEP. A SECOND STATION HAS BEEN IN SERVICE FOR SOME TIME INSIDE THE SO CALLED FUNCTIONAL CARGO BLOCK, ANOTHER SECTION OF THE I S S.

FRANK BAUER, KA3HDO, THE CHAIRMAN OF ARISS, THE GROUP THAT IS RESPONSIBLE FOR AMATEUR RADIO ON THE SPACE STATION, CONGRATULATED THE INTERNATIONAL TEAM OF LICENSED HAMS FOR THE SUCCESSFUL CONCLUSION TO MONTHS OF HARD WORK.

ON JANUARY 25th ONUFRIENKO IS SCHEDULED TO GO OUTSIDE AGAIN, WITH FLIGHT ENGINEER DAN BURSCH, KD5PNU, TO INSTALL 3 MORE HAM RADIO ANTENNAS OUTSIDE THE MODULE THEY CALL ZVEZDA, THE CREW COMPARTMENT THAT'S THE SIZE OF A PASSENGER BUS HERE ON EARTH.

HAM RADIO IS GROWING RAPIDLY IN SPACE, ALONG WITH THE INTERNATIONAL STATION ON WHICH IT'S INSTALLED.

FOR THE AMATEUR RADIO NEWSLINE, ROY NEAL, K6DUE

--

The Expedition 4 crew will remain on board the ISS until May. And according to Frank Bauer, KA3HDO, another important task is to bring the automatic packet system back on line. He says that ground technicians are working with the astronauts and cosmonaut on that project and that task will continue as crew time permits. (ARNewsline from information provided by ARISS, NASA.)

**

HAM RADIO RECORDS: 24 GHZ DOWN-UNDER

A new distance record is set on a band where even commercial interests are only now starting to tread. And its a group of Australian hams who have set it. Q-News Graham Kemp, VK4BB, has the details:

--

A new Queensland distance record on 24.048.1 GHz USB was established morning of Tuesday 08 January over a 72.8 Km path. Location 1 was at Wellington Point, with VK3ZQB and VK4ZHL portable. Location 2 was at Caloundra, with VK3XPD and VK5DK portable operating.

Signals strengths up to 5x5 after initial optimization with typical daytime QSB. The visiting team are continuing with local propagation experiments. The challenges of building and operating microwave amateur radio equipment are wonderfully rewarding in many ways!

From Q-News Australia, I’m Graham Kemp, VK4BB, for the Amateur Radio Newsline.

--

Further experimentation is expected to bring even more record setting contacts in this very microwave ham radio band. (Q-News)

**

RESTRUCTURING: BIG LICENSING SUCCESS IN THE UK

A new slow-code license recently introduced in the United Kingdom is also setting records. This in the area of people flocking to get it. Jeramy Boot, G4NJH, days that the new British Foundation License is on its way to becoming a major success:

--

The Radio Licensing Center reports that, as of the 7th of January, exactly 600 of the new M3 Foundation Licenses had been issued.

In the 'QSO Party' for Foundation Licensees that took place on the 1st of January it is estimated that about 100 M3 stations were active. Many joined the one-minute-past-midnight 80-meter net and many more were heard working DX during the subsequent days.

One person active on the 1st of January was Mike Marsden, M3BQH, who also holds the callsign G8BQH. Mike reports that he worked Alex, UR5EDU, in the Ukraine at

two seconds past midnight, using 10 watts on 40 meters. The report was 59+10dB. After a few hours' sleep M3BQH worked 66 stations on the first day, with only two short CQ calls.

"The pile-up queue was never ending, I even managed to work seven other M3s", Mike said.

Jeramy Boot, G4NJH

--

To put this in perspective. The UK has 57,814 hams so 600 is about 1%. Here in the United States we have close to 625,000 licensees. That’s the equivalent of getting 6250 hams signing up for a new license class here in the USA in only a few short days. (GB2RS)

RADIO REGULATIONS: FCC'S APPROVES DRAFT WRC PROPOSALS

The FCC’s Advisory Committee for the year 2003 World Radiocommunications Conference has approved its preliminary draft proposals. The document has been assigned as D-A-02-101 and deals mainly with satellite and terrestrial allocations in the UHF and microwave bands. Amateur Radio is only briefly mentioned in the area of 890 to 1350 MHz allocations.

The Advisory Committee itself was formed in January of 2001 to assist in the development of United States proposals for WRC 2003. DA-02-101 is based primarily on the committee report. Comments on it are due on it no later than January 28th.

The complete of 55 page text of DA-02-101 is on the FCC website at http://hraunfoss.fcc.gov/edocs_public/attachmatch/DA-02-101A1.txt (FCC)

**

ENFORCEMENT: CLEAN UP THE INTERFERENCE - PLEASE

The FCC has written to an A-M radio station and an electric power provider to help resolve an unusual and long-standing interference situation. One affecting local amateurs in the Cincinnati and Mason Ohio areas. Amateur Radio Newsline’s Don Wilbanks, KC5MFA, brings us up to date:

--

The letter suggests that multiple sources may be involved in this interference case. Also that two that are possibilities are Cinergy Corporation and radio station WLW. Cinergy is the electric company to the affected area and WLW is a Clear Channel Communications owned power-house AM station serving the greater Cincinnati area from a transmitter in Mason.

WLW operates on 700 kHz with 50,000 Watts into a single element diamond shaped half-wave vertical tower. This is only one of two such towers left in the United States, the other belonging to WSM AM in Nashville Tennessee. Both were constructed in the early 1930's by the now defunct Blaw Knox Construction Corporation.

One of the amateurs affected is Bob Reiff, WA8ULW, of Mason. Reiff told the ARRL Letter that while the noise is most noticeable on 160 meters, it's showing up elsewhere. He says that some local hams suspect it is even causing problems even on a two meter repeater.

In its letters, the Commission says that it recognizes this to be an unusual case. It says that the source of the interference could turn out to be something else unexpected. But the Commission adds that it is turning to the radio station and electric utility company and asking for their help in finding the source of the noise plaguing the Mason ham community. It's also asking that both cooperate with the technical experts from the American Radio Relay League in solving the problem.

For the Amateur Radio Newsline, I'm Don Wilbanks, KC5MFA.

--

By the way, More information on this very interesting Blaw Knox diamond tower design and the ones installed at both WLW and WSM is available on-line. Simply take your browser to http://www.wsmonline.com/w_homepage/tower/index.html. Its very interesting reading. (FCC, ARRL, Amateur News Weekly)

**

ENFORCEMENT: UNLICENSED OPERATOR TOLD TO EXPLAIN

A former ham that the FCC says may have been on the air without a license has been asked by the agency to provide an explanation. The person posing the questions is FCC chief ham radio rules enforcer Riley Hollingsworth, K4ZDH. And in a recent Rain Enforcement log, Hollingsworth outlined the situation:

--
Hollingsworth: "We requested clarifying information from Brian Bailey, ex-KD5PXQ. His license was set aside by the Wireless Bureau on October 19th. We want to know his exact whereabouts on two specific days in September. Bailey has been in touch with us and is deciding weather to provide the information."
--

According to Hollingsworth, the information that the FCC wants from Bailey relates to allegations of unlicensed operations and malicious interference. (FCC, RAIN)

HELPING HAMS: HAMDIHAMS NEW E-MAIL ADDRESS

This note: The Courage HandiHam System has a new electronic mail address. You can now reach the group at handiham@courage.org. You may also contact its Director Pat Tice directly at wa0tda@arrl.net. (HandiHams)

**

CONVENTIONS: HAMVENTION SAYS BRING YOUR BUS AND LAVE THE PARKING SPOT TO US

Free parking at the HARA Arena for Hamvention? Well, kind of. Its free if you leave your car at home and charter a bus to bring in a pretty large group of people to the event. Amateur News Weekly's Phil Thomas, W8RMJ has the not so complex details:

--

For Amateurs who charter a bust to make the annual journey to Hamvention, the Dayton Hamvention Committee will reserve a parking place for your chartered bus for the entire three days of Hamvention. The reserved parking will be close to the HARA Arena Complex, allowing not only a place to secure your valued purchases, but also a place to rest those weary feet after walking many, many miles of Hamvention. Space is limited for the new charter bus parking area. Pre registration is required. Availability is on a first come, first served basis.

--

For more information on the new on-site charter bus parking offer or to reserve a space, please contact the Dayton Hamvention office. It's open normal business hours Eastern Standard Time at are code (937) 276-6930. You can also fax your request toll free at
1-800-491-4267. (Amateur News Weekly)

**

CONFERENCES: SE VHF SOCIETY IN APRIL

Greg Robinson KB4NVD says over the VHF Reflector that the Sixth Annual Southeastern VHF Society Conference will take place April 26th through the 27 Th. in Oak Ridge, Tennessee. The conference, hosted by the Southeastern VHF Society, promises to be an interesting and exciting event with presentations from accomplished VHF and up amateur radio enthusiasts from several parts of the country. Registration, program details, hotel and travel information can be found in cyberspace at www.svhfs.org. (SE VHF Society)

**

HAM RADIO EVENTS: KIDS DAY A BIG MID-WEST SUCCESS

The first Kids Day operating event for 2002 was a rousing success in many venues. But in one Mid-West city a bit of coverage on a local T-V station helped to make it even better. Again to Amateur News Weekly and reporter Jack Parker, W8ISH:

--

Kids Day at the Indianapolis Chapter of the American Red Cross got a boost when event coordinator Stece Wendt, KB9RDS, made an appearance on a local TV news program. During the two minute segment. Wendt told viewers that all kids and their parents were welcome to share in the Amateur Radio experience, including an introduction to Morse Code, VHF repeaters and HF:

--
Wendt: “And then we turn around tand take them over to the big radios -- the big base station radios where they can talk -- literally -- around the world.”
--

This is the second year the local Red Cross chapter has shown young people how to tune in the world.

Reporting from Indianapolis Indians for Amateur News Weekly, This is Jack Parker, W8ISH.

--

This is just one of many Kids Day success stories. We will have more in future Amateur Radio Newsline reports. (Amateur News Weekly)

ARNEWSLINE(tm) FINANCIAL UPDATE WITH N6TCQ

It’s time for a report on the financial situation here at Amateur Radio Newsline. With it is our Support Fund Administrator and Corporate Treasurer, Andy Jarema, N6TCQ:

--

It is January of 2002. A brand new year for ham radio. And the beginning of another year for us here at the Amateur Radio Newsline. And as we start off the new year, here are the current finances.

Looking in the new corporate checkbook, the balance shows us at about $700 give or take a few bucks. Not very much when you consider that it takes over a thousand dollars a month to produce these weekly 20 minute Q-S-T’s.

Obviously, Amateur Radio Newsline is going to need your help -- and -- need it quickly to keep it from going away and to keep the news of ham radio coming your way.

We have done all that is possible from our side to keep costs under control. But, some fixed expenses like the telephone and long distance calling are a must have. So are electronic mail and world wide web access. There is the cost of the routine maintenance on the tape machines and editing gear. And in a few months the Newsline sponsored Young Ham of the Year Award will be rolling our way. All of this adds up and some costs just keep going up. When you add it all up and average it out, it comes to that $1000 a month figure I just mentioned.

So now is the time when Amateur Radio Newsline has to ask to ask that you help to keep its newscasts coming your way. Your tax deductible contributions can be sent to the Newsline Support Fund, Post Office Box 660937, Arcadia California. The Zipcode is 91066.

Ill be back within the next few weeks with an update on how things are going. For now from the Amateur Radio Newsline support center, I'm Andy Jarema, N6-Tiny-California-Quake.

--

Don't worry if you missed the address. It will be repeated in a few minutes at the end of this weeks newscast. (ARNewsline(tm) Support Fund)

**

ARNEWSLINE(tm): WE ARE GOING MP3

One other piece of news concerning Amateur Radio Newsline. As of March 1st, we will be dropping Real Audio and going exclusively MP3. Why the change? Well ever since we began posting a downloadable MP3 file at our own FTP site along side the Real Audio file, 9 out of 10 people have chosen the MP3. And with good reason. MP3 simply sounds a lot better than Real Audio to most of you. And by dropping the Real Audio, we can make the MP3 sound even better by encoding at a higher bit rate.

Right now, you can still compare the two formats if you like. Until February 22nd we will continue to post both Real Audio and MP3. Take the time to download both. And don't worry. Most modern media players including Real Audio, Microsoft Media and Winamp play MP3 so the chances are that you are already equipped to cover of the digital format change. (ARNewsline(tm))

SCIENCE AND TECHNOLOGY: THE NOISE OF EARTH

According to Space Daily, researchers have known for three decades that the Earth is a potent radio transmitter, but they were never able to pinpoint where the noise was coming from. Recently, by using data from the four spacecraft of the European Space Agency's Cluster mission, NASA-funded scientists have precisely located the source of the radio noise along the magnetic field lines. The noise originates several thousand miles above bright regions in the Earth's
northern lights. (AMSAT, Space Daily)

**

INTERNATIONAL-CANADA: ARE AGREEMENT IN B.C.

Turning to international news, Radio Amateurs of Canada which sponsors that nation’s Amateur Radio Emergency Service has signed a Letter Of Understanding and the British Columbia Provincial Emergency Radio Communication Service. The letter represents the collaboration between Radio Amateurs of Canada’s British Columbia Section Manager Fred Orsetti VE7IO and Supervisor of Information and Communications Technology for the Provincial Emergency Program Andrew Bryan VE7KSN, to provide a cooperative plan to carry out emergency communication. The letter also further enhances the work of the Canadian ARES program and compliments the Memorandum of Understanding signed May of 1994 between Radio Amateurs of Canada and Red Cross. (RAC)

**

INTERNATIONAL - CANADA: VE1AWA RESIGNS AS MARITIME PROVENCES SM

Due to personal reason Roy MacIntosh, VE1AWA has stepped down from the position of Section Manager for the Maritimes. Tom Caithness, VE1GTC has been appointed acting Section Manager pending outcome of the upcoming election call. (RAC)

**

INTERNATIONAL - UK: AMSAT-UK COLLOQUIUM

The 17th AMSAT-UK Colloquium will be held at Surrey University in Guildford from the 26th to 28th of July this year. AMSAT-UK is now inviting speakers to submit papers about amateur radio space and associated activities for this event and for the Proceedings document. Offers of papers should be submitted as soon as possible and should be sent only to Richard Limebear, G3RWL. His e-mail goes to g3rwl@amsat.org. (AMSAT-UK)

**

HAM RADIO IN SPACE: WEBSITE UPDATE

AMSAT reports that IK8XLD has updated his website with information about satellite operations, EME, the ham radio operation on the International Space Station, ATV and homebrew equipment. You can visit Rocco’s website at www.qsl.net/ik8xld. (ANS)

**

DX

In DX, DJ4KW and DK9GG are active from Belize as V31YN and V31GW respectively until about the 2nd of February. Activity is on CW, RTTY and PSK 31. (GB2RS)

And KE1F will be active on 10 to 160 meters CW, SSB and perhaps RTTY as ZF2LM from Grand Cayman Island from the 14th to 30th of January. (GB2RS)

Also R1ANF began operations as CE9 slash R1ANF on the 29th of December from a Chilean base in the South Shetland Islands. He is active on 10 to 28 MHz with 100 watts to an R6000 vertical. For all three, QSL as directed on the air. (OPDX)

Last but by no means least, word that JX7DFA, is on a job assignment to Jan Mayen. He is operating as LA7DFA. QSL via his home call. He will reply when he returns home in the Spring. (Modern DX)

**

THAT FINAL ITEM: A CALL FOR ARDF HUNTERS FOR THE WORLD GAMES

And finally this week, 2002 may be the biggest year yet for fans of hidden transmitter hunts, especially the ones that are all on foot. Amateur Radio Newsline’s Joe Moell K0OV helps coordinate happenings like these and has news of two major events.
--

Every two years, hams from around the world gather to see who is best at on-foot hidden transmitter hunting, also called foxtailing, radio-orienteering and ARDF. There are separate events on eighty meters and two meters, each with five transmitters scattered in a forest that can encompass 1000 acres or more.

Competitors are divided into five categories for males and four categories for females. Each country may have up to three persons per category on its team.

Back in Y2K, the championships were in China, with a dozen stateside hams among the competitors from 26 countries. This year, the excitement moves to Slovakia and takes place from September 2 through 7. Once again, ARDF Team USA will be there.

Would you like to be on that team? If so, contact me right away, because USA must submit its Letter of Intent to the Slovakian hosts by the end of January.

Of course you'll need lots of practice beforehand, and you can get plenty by attending USA's own national ARDF championships, which will be April 19-21 in Pine Mountain, Georgia, near Atlanta.

Find out about both championships -- Slovakia and Pine Mountain -- by visiting my Web site: www.homingin.com. Homingin is one word. Then apply for the Team USA roster at my e-mail address on that site, or by postal mail to my callbook address.

Maybe you'll bring home a medal this year. From southern California, where this year's local radio-orienteering training sessions will begin soon, this is Joe Moell K-zero-Oscar-Victor for Amateur Radio Newsline.

--

In case you missed it, Joe’s website is www.homingin.com. “homeingin” is one word. (K0OV, ARNewsline(tm))

534. Re: Anyone else have this problem?

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-18 18:42:00 UTC
From: k7itm@aol.com
Message-ID: <3200347.0201181042.792b603d@posting.google.com>
Source record: 47176

Heh, heh, heh! So...I'm not colorblind (at least not in human vision terms), and I can see just fine that the three-output power supply on my bench behind me has FOUR IDENTICAL 5-way binding posts, all with red rims around the front of the "knob" part. You gotta look at the label on the front panel to know which is which. At least the labelling is fairly large and clear, readable to me with or without glasses. It is good to be reminded, though, that I can't assume color will be enough of a label on anything.

The complaints about color-coded parts? Well...just go to all surface-mount and you won't have that problem. The only color-coded SMT parts I can think of right off are bobbin inductors. Fortunately, they're labelling SMT capacitors now, but for quite a while they weren't and it was impossible to tell whether something was 10pF or 10nF just by looking at it. Of course you may well need a microscope to actually be able to read the lettering on the parts! My 10X magnifier starts to fail me with 0402 size resistors. It's pretty amazing to me that they can sell 1% resistors, complete with label, for about a penny each. But even with good color vision, I have trouble with some color-coded resistors: some of the manufacturers use a "red" that looks very "red-orange" -- and others use an "orange" that's shaded awfully far toward red. Those are the two that give me the most trouble, and it's no use trying to get the "multiplier" band from context as you often can the first two (or three, for 1%) digits.

Cheers,
Tom

We called it brass-boarding back then (because of the similar old tube days technique of using brass sheets - copper laminated stock was non-existant that long ago) and 'dead bug-ed' (glued them upsidedown) the ICs too. Funny thing was that the RF circuits developed this way always worked better than the following laid-out PCB versions. Good ground planes and distance between parts was the key. For one-up homebrewing it's very hard to beat this technique for construction speed and circuit performance... alas, it /is/ butt-ugly though. :)

Some also use a brown that's reddish and a red that's brownish. I even
have a few 68K resistors where the blue and gray bands look nearly alike.

Surely a plane, flying inverted, only does so due to the skill of the
pilot. He is actually constantly keeping the plane in a controlled,
constant dive, but upwards (if you get my meaning). Also, if the
aerofoil section is assymetrical (top more curved than the bottom), the
lifting efficiency of the wings will be much lower when inverted.

All the top letters are made up from straight lines only. The bottom
ones contain curves.

73,
Ian.

538. Re: High Voltage Arcing???

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-18 21:13:21 UTC

Source record: 47195

Thanks for your input, Mike.

From the relay contacts, about 30 feet of wire runs out to the filament connections (using alligator clips to connect). When the tube arcs from the anode to the filament, the high voltage runs back along these wires, into the relay contacts. You will then see arcing between the relay contacts. What I want to do, is stop this high voltage from getting back to the relay contacts. I'm not sure the varistors, will handle this kind of energy.

You mentioned a screen. Tell me more about this? What is the idea of this?

Best regards....Brian

I'm not a pilot, but I was under the impression that the prohibition on flying at night wasn't due so much to inability to interpret light guns, but inability to distinguish wing lights. Without that ability, you couldn't tell if an aircraft was flying toward you or away from you. I thought the light guns were just used as a convenient and standard source of red and green lights for the test.

Definately not new!

Even cheaper and simpler is to go out and buy a bunch of small copper
or brass eyelets. Drill holes in vector board or even thin plywood.
Insert the eyelets and away you go! I did this back in the days of
Tubes!

Yes, but alas! not for long. I spent time waiting my turn on the 3905CC Net last nite disassembling the microwave. Turn motor, fan, trannie and touch pad all in great shape. Unfortunately, I used the magnets to demonstrate " levitation" by suspending neg. to pos. with a dowel rod thru the hole in their middles. This worked great unitl the 12 year old decided to get grabby and flipped the magnets around and dropped them on top of each other. Of course they're now in bits. Kids ! For grabbing from her siblings, interrupting, and trashing my magnets (future science project I thought) she is punished with no internet this weekend. She's sulking in her room as I write.

In the meantime, can I ask some dumb questions? First, what was the device I levered them out of ? I thought the magnetron was the literal tube (which was toast, BTW). Also, is the diode the small piece that looks a like a resistor and is fastened from one pole of the HV Cap to chassis gnd ? Says, " HVR-1X 3 and SK 0625" ? has the solid triangle with point on vert. line symbol on it. |>|

Thanks for the responses. I was planning on using a full size dipole antenna. I had heard that a preamp was a good idea for 20M. I plan to use this radio in remote locations and thought that by switching in a preamp I would be able to pull in some otherwise unreadable signals. But for now I won't worry about preamps or filters and add them latter as needed.

Brock Schuler, VA6BTS

546. Need data for 6AQ5/6V6 (to be used in a shunt regulator)

Newsgroup: rec.radio.amateur.homebrew

From: la8ak.xnd@online.no
Message-ID: <3c48c874.374759589@news.online.no>
Source record: 47187

Need to know the max anode current with 100V screen- and anode
voltage, zero bias
Suspect it is only 20mA, have some experience earlier with this type
as shunt regulator. Would also like data for the E80L. Only few
handbooks shows diagram for triode-connected device, and I have only
Philips handbooks for normal receiving types dated 1940, 42 and 67
Searching internet did not give any such information, only short data
was found, with voltage above 200V - which is not at all interesting
for my 90V shunt regulator

AVERAGE current on a triode connected 6AQ5 in that voltage configuration
is shown on a graph in the RCA manual as about 35ma. Does that help?
The 6V6 listing says to refer to 6AQ5.

Hello all,

I am looking for some formula's to make a computer program
wich turns my antenna's automatically.

the purpose of the program :

If I start a QSO with another station , I simply fill in his locator
in my program , and the antenna's must turn in his direction
automatically.

What I allready have :

I can convert the regular squares into degrees and minutes, so when I
fill in a locator, I know the other station's co�rdinates .

What the problem is :

Now I have my co�rdinates , and the other station's co�rdinates ,
but how can I calculate the angle (the azimuth for the antenna's to
turn to) between these two places ??
Does anyone knows some formula's or interesting sites to find out ?
or maybe anybody who has experi�nce with this kind of programs
who can help me on my way ...

If you can provide me some usefull information , than I will send you
a copy of my program (if interested ...) but I'm hoping to have it
online when it finally works .

Anyways , thanks for reading , best 73'
and good DX !

de Kevin , ON1DRE .

Maybe download the Grid Square Calculator at URL:
http://www.arrl.org/locate/gridinfo.html#programs

Perhaps examining the program will reveal the information you seek.

Ham Radio University 2002/ARRL New York City-Long Island Section Convention

North Babylon, New York - On Sunday, January 20, 2002 at 8AM, the doors of the Babylon Town Hall Annex on Phelps Lane will open for the third annual Ham Radio University. Ham Radio University 2002 is a day of education about Amateur Radio.

This year the forums have been expanded and new forums have been added. There will be twenty, one-hour presentations with special forums geared to the non-ham as well as the experienced ham radio operator. The focus will be "hands on" with many demonstrations.

Come join us at the Babylon Town Hall Annex, Phelps Lane, North Babylon, Long Island, and learn about everything from satellite communications, low power operating using radios as small as a tuna tin, how to put up an emergency antenna, the latest information on advanced digital communications, finding and fixing radio frequency interference problems to purchasing your first station equipment or handi-talkie and a special "Ask the Experts" forum. There will also be a Special Event Station W2V set up and operational on HF. There will live SSTV pictures uploaded to the NLI WWW during the event.

TALK-IN W2GSB/r 146.685 -600 110.9 PL

HRU 2002 is sponsored by the Great South Bay ARC and is a cooperative effort between over twenty clubs and organizations in the New York City- Long Island area. It is also the American Radio Relay League, New York City-Long Island Section Convention. Besides the forums, there will be tables set up with information about the different groups, ham radio classes, exam session schedules, public service and other activities.

Join us for a day of fun and education for the whole family!
Admission is open to all - donation is $2 per person.
(complimentary refreshments available)

For more information contact:
Phil Lewis N2MUN, Chairman, n2mun@arrl.net or call 631-226-0698
George Tranos N2GA, ARRL NLI Section Manager, n2ga@arrl.org or call 631-286-7562

Works good for me too (dialup at about 38k). In fact, I'd say it loads
FASTER than most given the amount of stuff on the page.

:) That was not one of the many answers I got. :)

This is really back-to-basics stuff for me. This is the very first time in
my life I've actually analyzed a coil. Before this it has always been
off-the-shelf, clearly marked and ready-to-solder-in where I was concerned.

I'm not much of a whiz with math, but I think I got it right. I used
the standard formula you see everywhere...don't know how to do math on
the keyboard, but you can double check with.. X turns=100 times the
square root of (the mystery inductance divided by the published
inductance per 100 turns). The published 100-turn number in this case
was 895.
In looking around on Google to see if there was an easy way, I found a
couple of online calculators. Great! but they didn't handle your core
size.

If it doesn't work, well, blame me :-)

Adios,
Bill WX4A

This shows part of the reason I got so many different answers.
<http://users.cyberelectric.net.au/~rjandusimports/ip_al_1.html> gives
460. Then from another page on the same site, 45 turns of #21 wire on
a T-80-26 gives 51.3 uH.
(http://users.cyberelectric.net.au/~rjandusimports/dc_choke.html)
Other places gave formulas that I tossed rough but close values into, and
that's where I got as low as 7 uH and as high as 22,815 uH.

Confusing!

> In looking around on Google to see if there was an easy way, I found a

And I don't have Java. :(Not *working* Java, anyway.

> > 1200 miles away, and could barely hear my freinds of only 12 miles away.

FWIW had similar problem many years ago in the military on approx 5
megahertz. AM voice about 25 watts.
As night fell good communication with a station some 10 miles away faded
out, while communication several hundred miles away remained OK. We
attributed to fact that we had not been communicating with a ground wave
at all but had been using sky wave reflection, even over the shorter
distance.
Then, as the sun disappeared the Heavyside/Ionospheric layers being less
intensely ionized contracted and came down closer to the earth and our
signals were just not being reflected correctly for the shorter
distance.
Just a theory! Terry.

Indeed. Apart from the oselectronics.com catalog that gives an AL of
895, I find it surprising that the new folks that have apparently taken
over Amidon don't have any of the AL charts on the website...or at least
I can't find them. They used to be there and IIRC they jived with the
ones on os...com
Time for the dipper.

Part of the question is how accurate do you want to be. That
basically means do you assume a spherical earth or use a more
accurate ellipsoid model.

There are tons of resources on the web if you start searching. Most
algorithms will be in C. Many others in fortran. I know of one
that's an Excel xls page. Of course there's the uncoded math formula
descriptions too.

Anyway here are a few links to start your quest:

http://williams.best.vwh.net/avform.html#Crs

http://ftp.census.gov/pub/geo/gis-faq.txt

http://www.anzlic.org.au/icsm/gdatm/index.html

Hope something in there helps. I've done this myself (not that I
totally understand the math) but I don't have just one short code
snippet to hand you. Here's one place I used this stuff.

http://www.dnai.com/~rexa/Projects/gl_dist.html

There is source code available for my palm program on that last
link, but you would have to dig out the relevant parts if you want
to write your program.

Good luck, and have fun.

-Rex, KK6MK

spam sucks more and more -- for mail, reply to:

the four letters < rexa > plus <the at sign> plus the four letters

> for 40 meters?

About 65-66 ft total "both sides" depending on where you want it
tuned. You can start a little long and trim to match if you have an
SWR meter. You really want 50 ohm coax of some type. Rg-58, rg-8,
rg-213, etc, etc. But about anything will work in a pinch. Even old
cable tv coax. It's 75 ohm, but assuming a perfect match with 50 ohm
coax, switching to 75 ohm would only give you a 1.4 to 1 match. No
biggie.. But if you have the money, you might as well invest in some
decent coax. I prefer 213 for HF. But even thin rg-58 will have fairly
low loss on 40m as long as it's not too long. Say over 100-200 ft or
so. Even then it's not too bad unless you go up to 10m. MK

Kevin,

You need to write a great circle bearing routine. Here's something I
found on the net a long time ago. (Unfortunately, I didn't remember to put
the URL in the document, so I don't know its source.)

Hope it helps.

Very 73,

Tom AB9B

Great-circle course (or bearing):

Suppose point 1 is LAX: (33deg 57min N, 118deg 24min W)
Suppose point 2 is JFK: (40deg 38min N, 73deg 47min W)

In radians LAX is

(33+57/60)*pi/180=0.592539, (118+24/60)*pi/180=2.066470

and JFK is

(0.709186,1.287762)

The distance from LAX to JFK is

d=acos(sin(lat1)*sin(lat2)+cos(lat1)*cos(lat2)*cos(lon1-lon2))
=acos(sin(0.592539)*sin(0.709186)+
cos(0.592539)*cos(0.709186)*cos(0.778708))
=acos(0.811790)
=0.623585 radians
=0.623585*180*60/pi=2144nm

The initial true course out of LAX is:

sin(-0.778708)=-0.702<0 so

tc1=acos((sin(lat2)-sin(lat1)*cos(d))/(sin(d)*cos(lat1)))
=acos((sin(0.709186)-sin(0.592539)*cos(0.623585))/
(sin(0.623585)*cos(0.592535))
=acos(0.408455)
=1.150035 radians
=66 degrees

563. Free flash PIC programmer software for Windows

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-19 11:25:21 UTC
From: g0jvy@yahoo.co.uk
Message-ID: <3373114e.0201190325.740e631@posting.google.com>
Source record: 47105

Most simple schemes for programming flash PIC microcontrollers involve direct connection of the PIC to a PC via either a parallel or serial port. Free Windows (95/98/Me/NT/2k/XP) software which can be configured to work with many of these schemes is now available from:

http://www.man.ac.uk/~mbhstdj/piclinks.html

There is currently very little supporting documentation but the most important functions should be fairly self explanatory. No support is offered although bug reports, expressions of frustration and so on can be sent to david.tait at man.ac.uk.

Tnx

Never knew such manual existed, but suspected it. Seems that I can use
this device. What is grid voltage for 10mA a+g2 current @90V and what
is the grid cutoff voltage (zero anode current) on 120V ?

Once used 6AQ5/6005/EL90 as a screen voltage regulator, but believe
6BQ5/EL84 is better because it has lower grid voltage swing from zero
to 40mA current with 150-300V anode/g2 voltage

Bill,

But of course ... but in DSP, they can be very nearly
ideal, with the result that out of channel emissions
can be VERY low because of what I said about the
undesired sideband and the desired occupying the
same frequencies centered about the (suppressed)
carrier, which is at channel center.

It is also clearly a question of spectral efficiency ... while "hi-fi"
audio might sound a bit better, it does occupy more bandwidth.
I think we need to consider the tradeoff of "communications
quality" audio vs. spectral occupancy (remember, the wider the
audio bw, the further out the IM products will extend as well ...)

> Also most SSB rigs suffer some of the same problems. Especially

I don't disagree with this ... but, as Gary has pointed out, that
is not really a problem with modern DSP-based approaches.

I find that most of the signals I hear are "acceptable" in
audio quality for the purpose of communication ... while

I also have to admit that you're correct that there are SOME
which are so distorted (over-driven/over-processed, etc.)
that they are hard to understand and unpleasant to listen to.

Your comment about having better sounding signals and still
being spectrally efficent is noted ...

I would agree with Gary's statement as being fundamentally
true, but would counter with the following points:
1) the I/Q LO(s) can be easily generated in dedicated
hardware using NCO technology with virtually perfect
phase and amplitude relationships
2) the filtering requirement is for 2 identical FIR filters
3) thus, one can make a tradeoff between dedicated
digital hardware and programable DSP
4) finally, CPU cycles are ever-becoming cheaper
and cheaper, rendering the issue of computational
complexity increasingly moot in terms of cost impact.

It's probably easier to transvert from 2 to 20 than it
is to transvert from 20 to 2.

I would start with a 130MHz crystal oscillator or
a 43.333... oscillator and tripler, a couple of
SBL-1 DBM's and a fistful of transistors.

I hope your 20M rig covers 14 to 16 MHz, mine doesn't.

> Mike

Sounds right.

I had forgotten the formula but the turns ratio is 100/39 = 2.564.
2.564 squared = 6.574. 450 / 6.574 = 68.45 microHenries.

Ah! the same as your figure.

I'm sending you a copy of the curve chart via private email.
Yes, the RCA Receiving Tube Manual is a common reference on this side of the pond. There aren't curve charts for every tube, but most common tubes are at least represented with specs. I'd suggest buying a couple of copies. The book came out every couple of years and I find by having, say, three copies - one each from about 1940, 1950 and 1960, that everything is well covered.
You can find them quite easily...ebay always has them. Not scarce like your EU Telefunken tube manuals. US$ 5-10 range is typical.

Kevin, it depends how accurate you want to be. For the purpose you set out, great circle calculations based on a sperical globe will generally suffice.

Here is an extract from a perl script that I wrote. I contains the algorithms that you are seeking. Perl is C like to an extent, hope it helps. Some functions may be defined elsewhere in the script, but the solution to them is trivial. These algorithms are well known.

This code also calculates the other stations's bearing to your station, which is not simply 180 deg different to the outbound bearing, although the difference is only small generally (depends on relative position of the two stations and can be large in the polar regions if you intended working there!).

```
#notes
#all angular measures are signed
```

```
#$latd, $latm are the latitude deg, min
#$lond, $lonm are the longitude deg, min
#$base???r are your lat/lon in radians

#convert lat and lon to radians
$latr=dms2r($latd,$latm);
$lonr=dms2r($lond,$lonm);

if($baselatr!=$latr || $baselonr!=$lonr){

#calculate the angle subtended

$distr=atan2(((sin($baselatr)*sin($latr)+cos($baselatr)*cos($latr)*cos($baselonr-$lonr))**
-2-1)**0.5,1);

#calculate the chord line in Km
$dist=1.852*60*180/$pi*$distr;

#calculate the bearing to

$bto=acos(((sin($latr)-sin($baselatr)*cos($distr))/(sin($distr)*cos($baselatr))));
$bto=180/$pi*(sin($lonr-$baselonr)<0?2*$pi-$bto:$bto)%360;
$xx=$bto;

#calculate the bearing from

$bfm=acos(((sin($baselatr)-sin($latr)*cos($distr))/(sin($distr)*cos($latr))));
$bfm=180/$pi*(sin($baselonr-$lonr)<0?2*$pi-$bfm:$bfm)%360;
}
```

> material?
>
>

Other than measuring? No - but:
On http://www.bytemark.com/amidon/content2.htm
you can find the characteristics you are looking for.
Then just make some 20 turns onto the core and measure the inductivity,
also measure the dimensions of the core. Next wade through above
mentioned material and look for the AL value. That is for 100 turns
of course. You need to calculate a little bit. The calculation can be
found in one of the threads down from here in the same group.
You can, of course make 100 turns - it's just time consuming...
Not all unknown cores are made by Amidon though but this will give
you an idea of what you have.
To measure the whole characteristics of a core you will need to
set up a test circuit and connect to a sweep generator and oscope.
Well, that's an ordeal which was described in UKW-Berichte 2/93 pages 71
to 58 and VHF-Communications 4/94 pages 93-109 sorry no web page
you might have to order a copy.
Look at http://www.vhfcomm.co.uk/vindxPage42.html

Hope this helps

> piece that covers it. Alas ! Any parts worth salvaging before I pitch
it??
==========
Components worth salvaging ...
1) Fine mesh screen in door (excellent for RF screening)
2) High Voltage diode
3) High voltage capacitor
4) Hi Temperature Sleeve insulation low voltage winding transformer + copper
wire
5) Hi Voltage 2 button toggle switch (often seen in older models ) I have
one rated 2600 V
6) Rotating glass plate (if fitted)
7) (Self tapping) Screws ,bolts & nuts
8) Power plug and cord
9) Any components ,being part of display unit

Note : this topic was extensively discussed on this NG abt 4 - 6 months ago.

Frank gm0csz.kn6wh@ntlworld.com

As an alternative you could use 8 ea 1000 Ohms ,3 Watts in series or 4 ea
2000 Ohms ,5W in series , of course space permitting.
Multiple resistors dissipate total heat much better than a single resistor .
Also the total cost will be less if you use standard resistors instead of
one-off specials.

Yes, I am aware of possibility to get answers about tube type
equipment there, also got replies for signal generators which you
would have expected from other NG's or newsreflectors

But some questions have been asked many times and every time I
received a lot of replies which had little to do with the question, so
as you see the other reply is the first I ever got from a person who
knows more than currents on 250v plate and screen voltages - when I
asked for 100V parameters

Also asked for product detectors in communication receivers, and rec'd
lot of mails and comments about 12kHz balanced modulators invented in
1918 using selenium or dry-diodes which could not pass anything higher
than 30kHz.... and has never been used in communication receivers

==========
Readers should realise that most if not all of the licensees with a M3 callsign already had a UK B class licence (equivalent to the US technician class licence) enabling them to operate in Ham bands above 30 MHz .They obtained a Foundation Licence callsign following a morse assessment (not to be confused with the 5 wpm morse test). The morse assessment is expected to be the last mandatory requirement in the UK for access to the HF bands before knowledge or morse will no longer be required following WARC 2003 .

The Radio Communication Agency (British FCC) has come to the conclusion that
WARC 2003 will highly likely decide to abolish the 'morse requirement' for
access to the HF bands by radio amateurs.
A very positive move indeed ,to stimulate the hobby of amateur radio
.....eventually amateur radio has moved into the 21st Century . The
10 Watts max RF power will also stimulate QRP operation.

Even if in the highly unlikely event the morse requirement would be retained
,the UK morse assessment complies with current ITU regulations.

We now can finally move forward and allow all to enjoy the hobby to the full
,including the cw operators !

In the Feb 2002 QST the article on matching short antennas
refers to a contra-wound toroidal air core inductor as being
a method to get very high Q. I've looked for more info, all
I can find is the CTHA antenna.
Is the CTHA the same winding method the author refers
to (contra-wound)?
Wouldn't a contra-wound inductor have zero inductance?

598. Re: How to get low freq quadrature signals?

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-20 00:20:18 UTC
From: Richard Hosking <zaprichardh@iinet.net.au>
Message-ID: <3c4a0c8a$0$13312@echo-01.iinet.net.au>
Source record: 47140

While this is a fairly difficult spec, I dont think it is impossible
A polyphase network could achieve one and one half decades of accurate phase shift (say 1 degree) with passive components and say 8 poles. We were able to do this to give a useful bandwidth from 300Hz to 8KHz which is roughly equivalent in span to 5KHz to 150KHz. The network is quite tolerant of error so 5% components would probably be OK. Set R=Xc at each pole spaced logarithmically over the band of interest.
Pole Freq

Fp=1/2*PI*RC

You should terminate the network with a high impedance (say voltage follower) and drive it with differential inputs.
The down side is component count (8 per pole) and loss (25dB or so). Also out of band signals should be prefiltered as they are less attenuated than in band.

See Elelctronics and Wireless World March 1994

If I remember correctly the 2nd harmonic products of the wanted side band show up as unwanted side band products in the unwanted side band and because they occupy the same spectrum they show up and interfere with the wanted side band.

It seems to me that a DSP ought to be able to take the audio waveform and use a DDS to generate the actual SSB output signal and dispose of filter and mixers and carriers for that matter.

Of course, there is the minor problem of spurs on the DDS and also the upper frequency limit of a DSP system used in this fashion.... Still, I wonder what the performance would be, spur level and frequency limit.

I have no way to judge, since I have little experience in this, but I am interested in seeing if anyone in the group might be able answer.

Thanks,

Jim Pennell

Thx., Frank. I did try to use Google to research before posting. However, I
found tons of questions regarding some older mag. article re: Microwave oven
to Microwave Transmitter conversion --- none on salvaging.

Negative on the HV toggle-switch. As for the rotating motor with fitted
plate- salvaged and perhaps they can be used to display my next project
on a rotating pedestal -- Hi, Hi. It's rated at 120/60/2.8 and goes at 3rpm
so maybe I could just plug it in the wall and set my beer and nuts on it:
Drink/chomp/Drink/chomp. I like challenges.

602. Another Inductor Question: With a "Twist"

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-20 04:59:48 UTC
From: Cathexis@yourhaterols.com
Message-ID: <3c4a49a0.137655093@news.erols.com>
Source record: 47144

Greetings All,

My question I know has been asked numerous times, but perhaps
not quite like this. I do have the ARRL Handbook, so if the answer
is staring me in the face in there please be patient and point me in
the right direction.

Basically, I want a formula to calculate predicted resonant freq.
of any coil. The usage here is for a crystal set. However, the twist
is I'd like to play with making the basic coil of the tank circuit into
a ** variometer**. This implies to me two different coil diameters,
one nestled inside the other, and wired in series. Assume just that
I need the minimum and maximum inductance.

In short, given a "target" freq. (or freq. range) how to figure the
coil dimensions,etc. for a variometer to use to resonant as needed?
I recognize that the communtative property,etc. may allow a large
possible number of coil " combinations ". Just need some sort of
equation to get started. Hope this makes sense.

Reticulum:

As you no doubt have already come to appreciate, the "Variometer" is a series connection of two inductors, call them L1 and L2, whose orientation can be varied by rotating one within the other such that the mutual coupling between the two can be varied all the way from completely opposing flux linkages to completely aiding flux linkages.

If the M is the mutual inductance between the two inductors L1 and L2, and if they are closely coupled, i.e. the coupling coefficient k is close to unity, the coupling coefficient k is given by k = M/sqrt(L1*L2), then the total inductance you can achieve ranges all the way from Lmin = L1 + L2 - 2M when the flux linkages are opposing each other up to Lmax = L1 + L2 + 2M when the flux linkages are completely aiding each other, which is almost a range of zero to four times the inductance of one of the coils.

In the usual Variometer one tries to get as close coupling as possible to make k very close to unity over a wide range of motion, so that in practice the two inductors will be very nearly identical in inductance, shape, etc... of course one is slightly smaller than the other, etc to allow one to move/rotate within the other, but....

Practically the best design for a variometer will try to achieve k close to one, usually this results in all of the inductances being practically equal to each other. i.e. L1 = L2 = M = L and then since k is close to 1 over some of the range of motion, the inductance range of a Variometer can be varied approximately from Lmin ~ 0 to Lmax ~ 4L, where L is the inductance of any of the two inductors.

Pretty neat for a variable inductor with no taps, no rollers, no shorted turns, no... etc... eh.

I've often wondered how big a Variometer would be needed to make a good "T-tuner" using today's HF C-L-C high pass tuner circuits, with the Variometer replacing the roller inductor or the tapped inductor. Maybe not as compact as the MFJ/Ameritron/Nye tuners, but I'd bet it looks a lot neater/nerdier, heh, heh...

In theory, theory and practice are the same, but in practice they are different, and so... you will enccounter "end-effects" and other such Murphy-isms that you cannot determine accurately until you build your Variometer and test it.

I'd start by designing one coil to a specific inductance in the range of 1/4 of what your maximum inductance objective is, and then make the second with almost identical inductance but slightly smaller to fit inside the first one.

Let us know how you do...

Best,

--Peter K1PO

Source record: 47146

Download program SOLNOID2 to design two coils, one of which slides nicely inside the other. Make the coils formers of equal length. Use same gauge wire for both coils.

Inductances = L1 and L2 microhenrys. L1 will not be very different from L2.

When connected in series but disassociated with each other, inductance = L1 + L2.

When series aiding, and one coil is entirely within the other, the inductance (for crystal-set purposes) = 2*(L1 + L2)

which is only twice as big so the frequency range with a fixed capacitor will be only 1.4-to-1 or less.

With series opposing coils the inductance can be reduced to zero but Q with small inductances will be very poor.

Variometers with opposing coils would have a terrible performance in transmitting antenna tuners. Inductance decreases to near zero but wire resistance remains at the same high value as when coils are aiding each other.

Q = Omega*L/R

OK for crystal sets if near the transmitter.

Reg.

==========
Just received the above type of tool through the UK G-QRP Club . Indeed an
excellent way for RF breadboarding
It even might be possible to use the tools for in situ soldering of
multi-legged ICs .
The pads (islands) cut with the tool have a circular copper area with a
diameter of 4mm (3/16 ") and an insulating ring
less than 1 mm (< 1/16") wide . It leaves the board with a maximum
groundplane and makes doublesided use a snip.
Effective homebrewing is now even more enjoyable.

>
>It's probably easier to transvert from 2 to 20 than it
>is to transvert from 20 to 2.
>
it's probably easier to transvert from 14 to 144 than it is from 28 to
144 for the reason that 5x 29 = 145MHz, 20m was used in the earlier
days of 2m converters and transverters, but one changed to 10m because
of 2mHz coverage. Mirror freq. products was also lower for 10m

it is sometimes not so easy for direct transverting, so one problem is
to go from 144 to 1296, and this is overcome in the Swedish UHF units
transverter (constructed by SM6DJH) with conversion from 144 to 28 and
then to 1296. while on receive side direct conversion for 1296 to
144MHz is done. This idea might be considered for other bands.

From: WebRat@wehackz.org
Message-ID: <aebm4u4mmdf1imujajjlrivljemio8fcrr@4ax.com>
Source record: 47007

Hi all,

I am in possession of a grid dip meter that I have no idea how to operate! I would RTM, but, there's no M to R ;) The only other ham I know is a off-the-shelf 2-meter only kinda fella. He tried, but doesn't know much more than I do about the thing.

If I understand what I've found about it, here's what I do.

1. install a coil to oscillate in the desired range e.g., 3.7 MHz - 8.0 MHz for 40Meters
2. after warm-up, adjust the output so that the meter reads at a setpoint on the scale.
3. place the coil near the circuit under test (2 turns of #22 solid wire across the feedline of my cut-freq 7.150MHz dipole in this case)
4. vary the freq control until there is a large change in the meter reading.

Here's the problem; the thing has several large fluctuations across the range of the selected coil, none of which seem to be harmonics of 7.15 MHz.

The VSWR meter shows me 1.2:1 at 7.15MHz, so the antenna is properly tuned, or the swr meter is lying.
Anyone got some help for a digital dummy attempting to climb into a vaccuum tube world?

thnx

well, I've never operated one (disclaimer), but are you saying that you
actually have a 2-turn coil electrically attached to the feedline?

I'd think that would mess it up but good.....and I've only heard of
using these to check the resonant frequency of a coil/cap tank circuit,
never a feedline

just my $ 0.02

The grid dip meter is for determining the frequency of a resonant circuit, your antenna plus the feedline is giving the GD a hard time... for this application you need an antenna analyzer,like MFJ 259 ...use the GD to find resonance in tank circuits etc..they are essential in amplifier building, traps, any high Q tuned circuits etc.. tto check an antenna with GD, connect the coupling coil to the feed point of the ant.. at the center of a dipole,at the base of a vertical etc.. some of the old handbooks have articles on using the GDO..good luck

[snip]

Quite right...

Although the mutual inductance M has no winding resistance per se, the
winding resistance of L1 and L2 remains the same whether their flux is
aiding or opposing, and so the low value of inductance L1+L1-2M caused by
the opposing flux linkages, will have a terrible Q!

Thanks Reg... you caught me again thinking out of the box again!

I have both an MFJ-259B and an old A/N-PRM-10 (classic old Navy GDO).
I'm no expert in either; But I knew I'd need them one day . The old GDO was my
first "fix-up" project and works very well. The MFJ-259B is a godsend and I now
use it regularly in tune-ups --- incredibly accurate.

The reason I mention all this is to make two small, non-expert suggestions:
1. Go to the MFJ web-site. They put their manuals out on the net and by reading
in-between the lines you can get some info on your GD as the MFJ-259B
includes those functions as well.

2. If your GDO includes an oscillator,..For a much easier test -- Put in a
coil whose freq. range covers any radio you own. Turn on the radio and
sit near it. Now twiddle the dial until - - Magic !! The music goes away.
Fun easy test. Or just wind some wire around a toilet paper roll and see
what you get. Also interesting.

I hope I helped,

Andrew

To end the story, as you say, when the two coils are series aiding the added mutual inductance introduces no extra resistance yet the total inductance is doubled.

But let no-one run away with the idea we have invented a super-duper very high Q coil.

The coil conductors are now in close proximity to each other and, have a guess, proximity (skin) effect and parasitic capacitance reduce Q to a smaller value than that of either coil alone. ;o(

It seems that I am attempting to look at my dipole from the incorrect
point..thanks, everyone, for that! In answer to your specific
question; No, the meter is not physically attached to the feedline. I
put 2 turns of wire across the feedline conductors and then put the
oscillator coil of my meter near those 2 turns, achieving an
electromagnetic coupling with the antenna circuit. Evidently, the
feedline was giving the meter a hard way to go. It seems to work
properly when used with a RLC ckt on the bench..
tanks! ;)

Hi Andy,
most advices are "make two coils of the same diameter, length etc.".
This is true for maximizing the inductance ratio, but impractical in
realization.
Variometers are used e.g. for L.F. antenna matching. Look at
http://www.sweb.cz/ok1fig/loading.htm , you will find a picture of a
homebrewed variometer. Search L.F. (136 kHz) ham pages for more about
making variometers.

I *might* have a couple of 50 MHz Q2334 DDS chips around here, if that's what it needs. They require an outboard DAC (I used the Harris HI5710 with them, if I remember right.)

You're better off with Richard Hosking's AD9854 boards, though... the newer Analog parts have their own clock multipliers and run way faster than the old Qualcomm chips. And they don't need a separate DAC.

You're right that many interesting links come up. Thx. My basic idea
was simply to see if using a variometer-style would be an adequate substitute
for tapping the coil.

Having read a couple books from the Xtal Society, I quickly saw that much
of what would be "improvement" in Xtal set design is kinda aesthetic -- meaning
improving on toilet paper-roll wound coils,etc. Some stuff is not for looks. I
think a variometer is a really neat-looking thing. Perhaps that's not a rational
remark. But then, the correspondence between beauty and rationality has been
debated since Aristotle --- Hi,Hi.. I think radio is beautiful -- Go figure.

Thx. for replying. I just wanted to calculate results of various coil
diameters in terms of the predicted resonant freq. of the tank-circuit. Your
reply will give me more food for thought as well.

=========
If you surely know the leads for the HV winding ,connect the winding to 120 or 230 V supply and measure the voltages on the other pairs of leads. (first establishing the pairs by checking (without power connected) with an ohm meter.
You now know the relative winding voltages from which you can determine the ACTUAL supply voltage winding.

In this way you can establish the various winding voltages from any mystery transformer.
If you are not sure whether the winding to initially power up is LV or HV apply a low voltage ,say 5-6 V from a known transformer and do your sums ,using a digital voltmeter. Be a Ham -detective and enjoy it !

Good Luck

Frank gm0csz.kn6wh@ntlworld.com

Download from website below program TWOCOILS which designs two different coils and calculates the the hard bits: - coupling coefficient and mutual inductance.

It doesn't go as far as calculating the series-aiding or opposing inductances but given the mutual inductance you can do that yourself with a pocket calculator.

But as I have said elsewhere, variometers used in wideband antenna tuners would be very lossy, especially at the higher frequencies. Which is why they are not used.

They have been used in the past as a variable sort of link coupling to load PAs into antenna transmission lines. A wierd sort of motion to watch. The control shaft comes out of the main coil at an angle of 45 degrees.

A number of articles on hairpin bandpass filters were written by Rick Campbell KK7B and Jim Davey WA8NLC and published in QST and QEX.

In which issues did these articles appear ?

645. FS/BO: Collins 30K-4

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-21 18:01:10 UTC
From: Walter Treftz <penguino@atlantic.net>
Message-ID: <3C4C5766.24D1120E@atlantic.net>
Source record: 47035

FS: Collins 30K-4 Vintage HF Transmitter.

Taking offers on my partially restored 30K-4 xmtr.
Several years ago I acquired this rig with the idea
of restoring it after retirement. The time has come
and I have come to the conclusion that I bit off
more than I can chew - not technically as it is very
easy to work on (in 5' rack) and straight-forward
circuitry - but timewise. I have been putting about 75%
of my spare time on restoration taking away from
projects that I am now more interested in (i.e., VLF,
antennas, D/F).

It is about 75% restored. On all the individual chasis
they have been cleaned and things like xfmrs, chokes,
etc. were removed, cleaned, repainted, replaced, etc.
Only the cabinet (5' Bud rack) remains to be refinished.
Most of the components have been checked by applying
either 110vac (via Variac) or B+ (variable 0-500vdc
supply) and slowly bring up the applied voltages to
season the electrolytics, check insulation, etc.

It is missing the tubes (6V6, 807, 4-125A in the RF
and the speech ampl/mod tubes). It has the 3-5 mhz
RF coils & xtals. It is unmodified in anyway. The
only addition has been a set of heavy casters so as
to move it about but I plan to remove these so it is
"virgin"

Digital pix are available (complete unit, before/after
of each chasis, etc) to the seriously interested. It
comes with a copy of the complete manual.

I am not interested in donating it and have a lot of
work in it along with the original price I paid.
Naturally, a pickup deal would be ideal as it probably
weighs 500 lbs or better.

If interested, contact:

Go to http://www.fncwired.com and download their trial version (for free). With it, you can tell how many turns you will need, for the cores that you mentioned. The program is called "FNC-Elcad". You will probably see other things in it as well, that are very useful.
Regards,
Brian

Try winding a coil on a suitable former (say 30 turns on a 35mm film
cassette container), calculate the inductance using the appropriate formula,
and put it in parallel with a suitable capacitor. Calculate the resonant
frequency and see if you get a dip with the GDO at that frequency. That
should show you how to drive the thing.

650. Re: QST contra-wound inductor

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-21 20:28:07 UTC
From: James Horn <jimhorn@svn.net>
Message-ID: <3c4c79d6@news.svn.net>
Source record: 47041

I may be wrong, but from what I remember of the article the reference is to a toroidal inductor with significantly reduced self capacitance. This is easy to do but not intuitive.

An ordinary single layer toroidal inductor suffers from capactiance not only between each adjacent turn but from the two leads (which have the largest voltage differential) being close to each other (thus, higher capactiance). For RF use, often a gap of around 20% of the core is left between the start and end just to reduce this.

An alternative is to wind 1/2 of the windings, run the wire across the core to near the start, then do the other 1/2 sprialling in the opposite direction. Then the start and end windings are opposite each other, reducing the capacitance even more. All windings are magnetically in the same direction, so the inductance is unchanged.

Source record: 47042

LA1ZM has problem with his Kenwood transceiver, the original device is MRF485, and my suggestion is to use 2SC2333 since it has much higher breakdown voltage. I am aware that somebody else has used this lowcost device, but not so sure about 10m performance

Do you have any experience with this device?
do you know the problems with 28V on driver transistors in Kenwood?
or do you know the gain.bandwidth for it

A local suggestion is to use 12V devices and run the driver with an extra 7812 regulator, a suggestion I do not like at all

sorry, fogot which transceiver it was

>Dave Heil K8MN

This is out of the L-4B instruction manual:

```
BLK/GRN -----)||(--------RED
)||(
YEL/GRN------)||(
||(
GRN------)||(
)||(
BLU------)||(
)||(
BRN------)||(
||(
YEL------)||(
)||(
BRN/BLK------)||(--------RED
```

For 240V operation, connect YEL/GRN to GRN, and YEL to BRN.

For 120V operation, connect BLK/GRN to GRN, YEL/GRN to BLU and YEL,
and BRN to BRN/BLK.

Is that enough info, or do you need to know how things hook up to the
L-4B?

First of all, you can get toroids at www.radioshack.com. For very small quantities, they are probably the best bet. Still, it's worth checking kitsandparts.com too, his shipping isn't bad and his prices are so low that you may find it reasonable. hehe .. I looked at your email and thought maybe getting them across the border costs, but then I looked at your call!!

Next, yes, the equations are in the handbook, and also if I recall on either Palomar Engineers or Amidon's web site. Basically, the number of turns is 100 times the square root of L/A where L is the inductance you want in microhenries, and A is:

T50-2 49
T50-6 40
T37-2 40
T37-6 30

However, the -2 and -6 mixes aren't totally interchangeable. The -2 is generally used at lower frequencies, the -6 at higher. There is considerable overlap in their frequency ranges, so there's a good chance that you may be in luck. The Handbook says that the -2 is good for 2-30MHz, but I've never seen them used much above 30 meters. Probably because the permeability is so high that you can't make practical inductors for those frequencies. The -6 is good for 10-50. That sort of says that your T50-6 may not be a good choice for 40 meters. You can still try, but keep in mind that the loss may be higher, and the inductance will be different from what you calculate.

..

I have a couple IC's that are SMT. For example MC1496 mixers
and an AD9832 DDS chip. In looking at the AD9832 I am somewhat
nervous about trying to attach small wires to the legs to hook them up.
What are some of the methods used? Is there any sort of small PC
boar available in a generic size that can be used to connect these
chips?

661. What parameters yield highest toroid Q

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-22 02:45:32 UTC
From: Jake Brodsky <frussle@erols.com>
Message-ID: <ukjp4ugpolucpitm1gcq5eddup6d74omgd@4ax.com>
Source record: 47053

Ok, I know this is a very broad question, but I'm curious what combinations people have used.

For example, I've read that 17 turns of #18 wire on a T-68-6 core will yield a Q of nearly 400 at around 10 MHz. That's off the charts of the literature Amidon distributes.

First, is this a realistic Q figure?

Second, if this is realistic, can I scale this performance to an inductor on another frequency, using materials such as #2 or #7? All other parameters such as toroid size, wire size and number of windings can change, I'm primarily looking for the combinations which will yield the highest Q at some HF frequency.

Third, there must be more complete references on this subject than the literature Amidon gives out for free; does anyone have suggestions?

Thanks in advance and 73,

Jake Brodsky, AB3A mailto:frussle@erols.com

True, if you can't tell the difference between red and green wing tip
lights night you may have a small problem. I hadn't thought of that.

Still, there are exceptions available too. They're called Statements
Of Demonstrated Abilities (SODA). It's commonly used to get waivers
and occasionally restricted privileges for handicapped pilots. This
guy could get a SODA limiting his night operations to Towered airports
under instrument rules. When flying under instrument rules, the air
traffic controllers are responsible for separation...

If this guy is still interested in flying, tell him not to give up,
there are ways he can get a certificate.

Yes, there are,

The brand I know of are called SurfBoards. Digikey sells them. Find Surfboard's webpage and get the real data there so you may select what you need.

Hi,

I'm trying to find the specifications (or any other information) for a coax switch I have. It's made by DB Products and is marked:

Model : 5S04E19
Voltage : 115 VAC
Ser No : 37-6

Any info would be appreciated.

Thanks

Bruce

Yes radio shack canada only carries a fraction of the parts as radioshack
us.. but will check there for sure... and thanks for the info on the cores
i am understanding a little better.. will try the t-50s but if it does not
work no loss i suppose i will buy the premade inductor...

:) Yes an american ham in canada... Luckily with the recent change in
canadian regs i don't need to relicence for up here however i think i may
take all the tests only two knowledge and one code to get full permissions
and a lifetime license... will have to see.. I'm re-learning code so that i
can use my new radio soon so that should help me with the canadian tests..
Thanks for info and have a good day.

Current discussion over on alt.audio.pro.live-sound and rec.audio.pro regarding the distribution amplifiers sold for use with multiple wireless microphone receivers.

The one I looked inside of appears to have a single active device (a Mini-Circuit IC?), input bandwidth (bandpass) limiting, and output build-out resistors. Is it really this simple? My gut feeling is that it IS that simple, but that laying out VHF and UHF circuits is not a walk in the park, either.

Are there any generalized circuit designs/layouts for this? (That could be customized for operating band with input filtering, etc.)

Thx, RC

Hi Jan-Martin.
(Answer in English. Do not think the rest of the world
would like a Scandinav-mix language).

This is in the TS930, isn't it?
MRF485 = Dritt!

No additional data available in MWO, ADS or my Motorola
handbook (to old?). Only rudimentary info found. Strangely
enough, it is specified Vceo[max] = 25V, not 28V. If this
is the problem, the MTBF sucks, and the Kenwood engineers,
well...
I do not know if MRF485 is EXACTLY as 2SC1307, but they are
said to be replaceable. This is often used as PA in CB (27 MHz)
equipment (yuck!), and usually fed with 12V (possible cause of
proposal to use 7812??). Perhaps it's easier to track data of
this one (I have not made any serious effort!).

Best regards/treoghalvfjers (73 in Danish)

========
IMHO ,implementing the above proposal would constitute the worst form of
discrimination.
If people are really interested in the hobby of Ham Radio ,whatever their
colour or creed , they will be able to get a licence by studying basic
electronics and operating procedures and I am sure most elmers and clubs
are prepared to assist anybody with the required study ,either individually
or in a group. However the prospective hams MUST show at least an INTEREST
in the hobby to succeed.
I feel that's where the problem is ...true interest in any hobby seems to
be dwindling fast in our "comsumers' society" . Not just in the USA but in
many other countries ,also in Europe. The Key word is 'interest' which
can be best stimulated during the school years either by the school
curriculum or through extra-curricular activities. The ARRL's "BIG
Project" is in my opinion a superb way to reverse the trend and will ,no
doubt, be a stimulus for many to embrace Ham Radio , irrespective of their
ethnic or social background .

Large 50-0-50 Microammeter Panel Meter & Box - Ebay

This is a superb meter that measures 50 microamps either side of 0. It is shielded and is made by API. It has a beautiful movement, and works perfectly (just checked it today). This is a large meter with a 5.5 x 4 inch face.

It is mounted in a deluxe enclosure, with a hinged top, banana type connectors, and rubber legs. The enclosure is approximately 7 x 7 x 7 inches. The enclosure has superficial scratches in the paint (for a perfect appearance, I would repaint the enclosure).

For auction on Ebay, click on:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1691323103

I will be glad to provide additional information. Contact me at w4tq@mindspring.com

Hello,

I have a Astatic TUG-9 Stand and a D-104 head that I put a electret condensor element into. There isn't any pre-amp circuit and I power the element from a 9 volt in the mic base. I am getting RF into the mic that is causing distortion on the transmitted audio - I know it for sure because it happens when I turn the RF power up. I don't have the problem with the stock microphone. I have used bypass capacitors across the lines leaving the microphone and still have them problem - what else can I try? I have grounding bus and < 1/4 wavelength grounding strap to ground (basement station).

Thanks,

Scott.

DSP speed limits you to a frequency in the low tens of kilohertz range,
but a DDS isn't needed since the DSP can generate the carrier directly
via indexing into a sine lookup table. This is the way SSB is generated
in several modern amateur transceivers.

Now a hybrid system doesn't have the frequency limitation posed by
DSP speed. If you do the I and Q audio in DSP, the carrier with a hardware
DDS (followed by suitable cleanup PLLs for the main and quadrature channels),
and mix in a traditional pair of balanced mixers, you can operate directly on
virtually any frequency.

Rick Campbell's R2 and T2 updated with DSP for the audio is an example
of this sort of design. I've built this sort of transmitter and receiver, and there
was an article in QST a while back outlining a similar system. Performance
is limited primarily by how well the analog balanced mixers are matched
(and you can tweak the code to compensate for some imbalance).

Hi Scott,

Here are some suggestions, some of which you may have already
tried, but I can't tell from original message:

- Use shielded wire for all audio connx inside the mic.
- Put a bypass cap on the positive battery lead.
- Put ferrite beads on the mic audio and PTT leads inside the
mic plug, right where the wires are soldered to the pins.
- Verify that the shield on the mic audio lead in the cable
has not opened up on you.

Questions for you:

- Does the stock mic have a dynamic element or an electret?
- Where have you installed bypass caps? What value?

I ask one stoopid question on toroids and people are breaking loose with all sorts of questions. It seems to me there's a need for a web tutorial on using toroids (especially winding coils and transformers with them); anyone know of any good ones? I didn't find any in my quest, just enough scattered (and conflicting!) information to half-answer my questions.

If we can't find one, I have the time and inclination to write one if I can get some knowledgable help. As mentioned before, I know next to nothing about the subject.

Is it a coiled cord? In my case running a direct wire from the plug at
the rig to a common gnd inside the mic solved the problem. Don't know
if it was simply poor shielding or possibly some resonance due to the
cord. Anyway, it fixed it. (D104 + IC-745 barefoot)

It's not a web page, but it's a good book:

Ferromagnetic Core Design & Application Handbook
M.F. "Doug" DeMaw

Printed by MFJ, runs about 250 pages, costs about $20,
can be found on Amazon and other book sellers.

685. Re: Salvage Parts from a Microwave ??

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-22 21:14:51 UTC
From: John Fletcher <John@kanga.demon.co.uk>
Message-ID: <ncuAhBALZdT8EwkN@kanga.demon.co.uk>
Source record: 47077

How about using the whole cabinet (if it survived the fire) as a Faraday
cage for receiver tests? Put some N or BNC connectors through the wall.
Run the lamp from an internal battery so you can read the mV meter.
Blank off the mains input socket. I built my Faraday cage because my
microwave still works...

Hi Michael,

It really wouldn't make a lot of sense to design and produce a new setup
as the market is flooded with them now. Plus those original Heathkit
uMatic (micro matic) keyers are all over Ebay. I have one myself and they
work pretty well. I still prefer my vintage original Ham Radio Outlet one
knob keyer though.

I might mix-up 2SC1307, which seems to be the one LA4BL used in his
TS-850(?). Think it is stupid to use 12V transistors and convert the
power supply, a much better solution for TS-930 is to use a very
simple 24V regulator for MRF485 devices

The Motorola RF Device Data book is marked "Aalborg University" - so
it should be reliable, it says V(BR)CE0=35V

http://www.radioshack.com isn't much like the store. The stores do not carry toroids. However, rs.com's price is not a lot different than Amidon or Palomar Engineers, but their shipping is better. They are, however, packaged in lots of 3 or 4 depending on the size and mix. At Palomar Engineers you can buy 1, but the total shipped price will be higher.

> :) Yes an american ham in canada... Luckily with the recent change in

Ah, so you DO have the shipping/customs challenges. Well, maybe it's not so cheap then. I just don't know what you need to deal with. Even so, if you only need one mix, diz may be better. He will sell you 25 T50-2's for $6 plus $3 shipping (plus whatever the deal is getting into Canada). 4 T50-2's at rs.com are 4.80, with shipping at 2.50. so an extra buck and a half from diz gets you 21 cores for future products. Who knows what the international shipping will do to you, tho.

On the issue of ordering, there is a thread about where to get toroids
in Canada on the RAC (Radio Amateurs of Canada) messageboard right now:
http://rac.eton.ca/data/racdiscs.taf?

Nobody could come up with a real good source in Canada. Someone suggested
Electrosonic in Toronto, but I thought they had a stiff minimum order
requirement.

When it's come up here before, I thought people have suggested
local outlets, that also happened to do mail order. I seem to
recall Laura suggesting a place in Vancouver.

Dan's Small Parts, I'm sure I posted the URL over at the RAC
messageboard, may be one of the better options, because the
"shipping and handling" isn't too dear, and if there is a minimum
order, it's quite low. If there are some other RF components
you want or need, he's worth looking into.

Someone over there suggested Amidon itself. I'm not sure
of their policy to Canada, but it is a useful suggestion since
they went into business at a time when toroids were fairly new,
and their market was those who needed them in small quantities.

Someone suggested Radio Shack. From a recent thread elsewhere,
I gather that you cannot order from the US website, you have
to use http://www.radioshack.ca if you're in Canada. And I suspect
they don't carry toroids.

I'm not sure the people in the US realize that not only do we
have to deal with higher shipping prices in many cases, along
with duty at the border, but the fact that the Canadian dollar
is worth something like 64 cents American means that what starts
out as a fairly reasonable price gets quite a bit higher by
the time we send off the money.

Anybody/Everybody:

How come nobody every asks "How do I solder these damn surface mount parts"? Seems everybody would want to know how everybody else is managing to pull it off without massive frustration, wrecked parts, blurry vision, etc. Did someone just forget to tell me again?

I've been collecting parts from the local surplus store (i.e. Princess Auto) I'm just about ready to take a rip at building a machine. I'm hoping there are a few people here who have fooled around with this enough to have some useful suggestions.

Here's what I've collected for parts:

1. The stuff for a 24V, 25A power supply. This includes two 12V, 25A transformers, a +12V and a -12V regulator, eight NPN and eight PNP power transistors, sixteen 0.1 ohm emitter equalization resistors, twenty 4700uF 50V capacitors, etc. I've used these same parts successfully in a 25A @ +12V variation of an ARRL handbook circuit (which claimed >10A @+28V) so I'm going to try to get away with simply a positive one and a negative one (with PNP pass transistors) and hope the impedance presented to the wall from the two parallel primaries doesn't turn my lights out. Anybody have a suggestion for an in-rush current limiter for when I hit the power switch?

2. A Curtis PMC 1505 pulse modulation power controller (originally intended for electric wheelchair/mo-ped use). The data sheets say 20A continuos, 80A for up to 1 minute (at 24V). I'm going to trim my heating element (see below) for about 500W max so this should give me good control over the heating power.

3. A heating element (which looks like it might have been made for a small kitchen oven originally) which says 1500W at 117VAC. It's got a nice removable/reusable power connector and the element material cuts fairly cleanly and easily. I haven't fooled around with it much, but I suspect my biggest problem is going to be the low resistance, high strength, super-high temperature connectors which I'll need to connect the segments I'm going to cut. I'm not sure what I'm going to do for a thermal insulator where the element assembly bolts to the frame either.

4. A length (4ft at the moment) of 1/8" (inner diameter) copper tubing which winds easily around the heating element with only minimal obstruction to the air flow through it.

5. A tube (a pair of tubes actually) of JB Weld. Looks like epoxy glue, one tube says "steel" the other "hardener". The package says "max temperature is 600 degrees F." and "does not conduct electricity".

6. A 12V air pump (originally made for a car accessory which allowed you to inflate the tires using the cigarette lighter). I've even got a spare one if I need it. They do have a nice pressure gauge attached (goes up to 200psi) but no pressure shut off, etc.

7. A copper welding tip normally used with an oxy-acetylene welding system. It has a female end which mates fairly well with my copper tubing (i.e. a bit of JB Weld should do it).

8. A 30" linear slider with motorized screw. It looks like it might have been from a scanner, copier, etc originally. I've got a spare but I'm leery of trying to use them both together since the "model car" motors driving the screws would be difficult to control. I also have a pair of dresser drawer sliders with about the same length of travel.

9. Assorted valves and connectors (including a nice assembly with four solenoids controlling a one-in four-out air flow distributor).

I've got my eye on the parts below and I'm just waiting for the "clearance price" that's probably coming soon.

10. A pressure tolerant plastic "bottle" with two airways through the cap. The one I'm looking at already has the piece of tubing running from the inside of the cap to the bottom of the bottle on the air-in hole. I'm thinking I'll run the power for the immersion heater (see below) and the connecting wires for the water temperature probe (see below) inside the air-out plastic tubing (i.e. through the other tube). Once the wires are outside the bottle I'll use a Y tubing connector and silicon caulking (and maybe a screw clamp of some sort) to get them out of the pressurized system.

11. An immersion heater which might have been designed for a kitchen kettle originally. It's 117VAC but till I buy it I'm not too sure of the wattage. For this initial version I'm thinking a triac/diac power control to manage the input power by hand. The circuit in the triac datasheets looks quick and painless.

12. A means of determining water temperature (between 20 and 110 degrees C). Eventually I'll want whatever is controlling the immersion heater to be monitoring the water temperature, but for the time being I'm going to use a thermometer probe with attached LED readout circuitry which is small enough to fit right inside the bottle (if I can figure how to mount it). I'm simply going to run it's 12V supply into the bottle and read the display through the bottle wall. This is going to be a pretty steamy environment so I'm thinking I'll wrap the circuitry in plastic wrap or something before it goes in.

13. A pressure sensor with hystersis and associated circuitry to stop and start the 12V air pump(s). I'll probably make this the very first thing I add after I prove to myself that this thing will actually solder parts. Till then I may just flip the power on and off and watch the pressure gauge(s). Why did that sound so much like famous last words?

14. Last but not least - an over pressure release valve of some sort. The pressurized system as a whole will no doubt leak like a sieve long before it

reaches dangerous pressure levels, but it's hard to come up with a good reason not to include it.

In a nutshell the procedure would be:

1. Spend as much time as necessary staring through the magnifying lens, syringe in one hand dental pick in the other, applying solderpaste to three or four pads (/pins) at a time.

2. Take the board out from under the lens and mount it on the linear tracking "table". At this point I don't have any good hardware to allow me to fine tune the position in two directions but some kind of XY adjuster system would be ideal. For the time being I thought I could provide a fairly long "base beam" running perpendicular to the sliding direction. The position on the beam where the board was clamped would determine one axis. The base beam would also contain a long bolt extending through the beam parallel to the sliding direction. The bolt could be move "in and out" to determine just how much linear sliding occurred before an end-of-travel switch killed the screw motor. This should allow accurate, repeatable control over the other axis.

3. Make sure the water temperature and bottle pressure are at the right initial levels (i.e. as determined from experience).

4. Open the air flow out of the bottle toward the heating element.

5. Crank up the power to the heating element. Again experience would determine the correct level.

6. Wait a predetermined amount of time for the heater element and all that copper to warm up. At some point the air pump(s) will probably need to be cut in to bring the pressure back up. This will no doubt have a large impact on water temperature as the room temperature air is bubbled through. This part will take some practice.

7. Close the airflow from the bottle to the heating element. At this point the heating element power is at max and the air stuck in the copper tubing should be getting very hot very fast. It is probably going to be the case that the air pump(s) will be running at this point so the pressure in the system will be near maximum when the airflow is re-opened.

8. Bring the linear tracking "table" under the tip. In a future version I may use a small drill-press assembly with a motor and clutch of some sort to bring the tip down toward the board once the linear table reaches maximum travel. For this version I'm thinking I'll assemble boards starting with the inner most components and working outward. This way the tip would not have to pass over any parts during the linear tracking and could be set just high enough to clear the leading edge of the part being soldered.

9. Open the airflow from the bottle to the tip. The initial blast of air coming out of the tip should be hot enough to melt solder paste. There should be enough energy in the stream (from the moisture content) to effectively heat the pins, tabs, etc as well for a proper joint. Right?

10. Kill the power to the heating element.

11. Close the airflow from the bottle to the tip and restore pressure to the initial levels needed for the next round.

12. Restore the linear tracking table to it's initial position. If it looks like a success it's back to the lens, syringe, and dental pick. Otherwise it's back to step 3 for another blast.

Suggestions appreciated,

Mike Whitfield (VA4MGW)

Hi Jake and Group!

You might want to check our the "Technical Correspondence" in the Feb 2002
QST for the article by Grant Bingeman, KM5KG. He states that the "Q" of
toroidal inductors can be drastically increased by using "contra-wound"
toroidal windings on an air core. I don't know what he means, but his email
is given as DrBingo@compuserve.com

Best to all.

703. Free parts for new homebrewers

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-23 07:51:47 UTC
From: k7itm@aol.com
Message-ID: <3200347.0201222351.768a3622@posting.google.com>
Source record: 47093

Any new-ish homebrewers out there, or perhaps Elmers getting new people started, or folk trying to teach classes, who could use some free parts? I'm trying to put a bit more order into my rather large "junque box" (or is that "Stash of Trash"?), and would love to donate some parts rather than toss them into the garbage. At the moment for instance, I have about 40 SN99121P's which I believe are essentially 747/1458 type dual op amps, but I'm sure there will be quite a few 74LSxx/74ALS/74F/etc (maybe even some 74HC) digital parts, and assorted RAM (mostly static; some fast [35nsec or so] static; some dynamic) and assorted UV-eraseable proms. There may also be some analog parts, resistors and capacitors and assorted small transistors. The main catch is probably that you'd have to convince me that you actually have projects (learning and/or building) to use the parts...and be willing to pay postage or pick them up.

Any interest?

Cheers,
Tom

1 Canadian dollar equals 64 US cents which equals 5 Hong Kong Dollars or
5.68 Mexican Pesos.
Its the same amount.
If your logic were true, we Yanks would be buying everything in Canada
to take advantage of that discount that allows us to get $1.60 worth of
goods for $1.00.

>Also, while on the subject of colour vision. Does everyone have the same
>spectral range? I.e. Where does red stop being red and become infra-red and
>is it the same for everyone?

Of my three sons, two are colour blind. Colour perception problems are
most prevalent in caucasion males (~20%) and is generally hereditary,
being passed through mothers to sons. Their mother is OK but their
maternal grandfather was also colour blind.

FWIW, I believe colour blind people have a different colour
"bandwidth" and/or range to the normal response. My youngest son would
marvel at the most "boring" sunsets and wonder what his mother and I
were on about when we talked about "spectacular" sunsets, suggesting a
spectral shift. To illustrate this point, compare a colour visible
light image and colour infrared image of the same subject. Some of the
infrared camera/gun manufacturers often hav pics on their websites or
in their ads.

But every cloud has a silver lining. Very often, clour blind people
have very acute tonal sensitivity, which is why colour blind people
are often employed as aerial photo reconnissance interpreters.

Hello Scott,

I used to have the same problem on my D104.
Whenever I turned on my Amplifier, it fed back to my audio.
The stock microphone cable was ok, so I added a Ferrite core,
and all my problems went away..

713. 17 meter SSB project

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-23 22:41:57 UTC
From: n2cqr@clix.pt
Message-ID: <3c4f3bb7.757663@news.clix.pt>
Source record: 46955

. I thought you guys would like to hear about my current
project, a homebrew SSB rig for 17 meters.

Most of the design is from an article in the British QRP magazine
SPRAT (Nr.48) by Frank Lee, G3YCC (now a Silent Key). Solid State.
Manhattan style construction. Junk box parts. My version generates
the SSB at 5.173 Mhz. I had an old set of crystals from the filter
and carrier oscillator in a Swan 240. The balanced modulator uses two
diodes. After the filter there are two stages of amplification then
the signal goes to an NE-602 mixer. The oscillator here is outboard
to the NE-602. I upconvert to the operating frequency.

That's how far I've gotten at this point. I'm looking around for RF
Amp circuits that will take me up to around 25 watts. I want to stay
with 12 Volts DC. Any suggestions? Are the kits based on Motorola
circuit notesstill around? I also thought about adapting a 20 meter
amp kit that Ramsey
sells.

Once I get the TX going, I might go ahead and make this rig a
transceiver. I have plenty of room, because I'm building this thing on
the chassis of an old DX-40. I'll also use the front panel and
cabinet from the old Heath.

Is there any schematic capture software available that moves wires along with parts, i.e. the part doesn't get disconnected from the circuit when you move the part?

Maybe I got spoiled by LabView years back, but it seems to me that software that *doesn't* do that is next to useless for anything other than pretty pictures.

Funny, but not quite accurate as the finished key is
still seen as "mounted" on a piece of rectangular
something. (block of wood?). Still, looks like fun!
Have you used it?

I would contend that 3 pins, 1 paper clip and a sm.
block of wood is equivalent to,....

1 clothes pin
2 thumb tacks

Thumb tacks are pushed into the clothes pin so they
contact when the clothes pin closes. You squeeze the
clothes pin to break circuit, relax to transmit.

Sooo, you read the gaps between the signal? Kinda reversed CW?
Clothes pin hard to press, I like paper clip mo better, you can even stick the tacks into the table and get key that never slides.

Source record: 46965

http://www.geocities.com/CapeCanaveral/Lab/9595/fst3125.html

This website has some information on the mixer and a few test results.
It also has links to some schematics as well.

I have the original article around here somewhere and it goes into
discussions on how to make the crystal filters good enough to handle the
mixer.

It's interesting that most commercial crystal filters will overload
before this mixer does....

Although, the next problem would be the LO phase noise and spur
performance. Even ignoring the crystal filter overload and LO limits, the
mixer will fix a LOT of intermod in the front end of a radio.

==========

I am going to get the Pericom PI5C3125 which is their cross for the
FST3125 FET switching IC.

Seems to me I saw this chip on Digikey and I already have the toroids so
it ought to be easy enough to build. I love the dynamic range of this
mixer !!

Hi Mike,
I tried similar simple "Morse keys" many years ago. They worked, but a strong pain in fingertips was their "byproduct". A really usable Morse key must always contain some sort of "soft stopper" not to damage your fingers.
Btw., one even simpler key for QRP was published in QST. You take a metal pen with a pocket clip, insulate the clip from the pen's body and connect one conductor to the clip, the other to the body. You key CW by touching the clip with your finger...

Source record: 46969

I think Jim Horn's posting explains it, but I'll try different words, since it's probably a bit confusing. Start at point A on the toroid, and wind turns, going around the perimeter of the core in a clockwise direction, and stop when you get half-way around at point B. Then start at same point A and wind turns going around in a counterclockwise direction. Now connect the two windings so their mutual inductance adds...that is, first wire from the finish (point B) to the second wire at the start (point A). Then the two remaining wires, first wire start and second wire finish, are the inductor leads.

Saying the same thing yet another way: start with a length of wire. Double it over--fold it in half, if you will. Pass the folded loop down through the center of the core. Now pull one of the free ends up through the middle to the right of the loop, and the other free end up to the left of the loop, and continue adding turns in this way. When you get enough turns total, cut the loop, and connect the loop-end of one winding to the free-end of the other winding. You can think of the two windings as being "right-hand threads" and "left-hand threads" around the core.

I may be mistaken, but I seriously doubt this will be a "silver bullet" that will make everything super high Q, especially at frequencies well below the self-resonance of the coil. And with a powdered-iron or ferrite core, a great deal of the loss is in the core and is not dependent on the winding style. I can believe an improvement, but not magic.

Cheers,
Tom

728. looking for basic am/fm transmitter

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-24 08:01:56 UTC
From: Eric Heinz <EHeinz@optonline.net>
Message-ID: <UbP38.18755$6L5.3462686@news02.optonline.net>
Source record: 46970

hey all, i'm looking to basically build a small am/fm transmitter with a couple of miles of range. from what i gather this is based much more on the amplifier you use than the actual transmitter so i wanted to know what difference the transmitter makes. im also unsure how exactly you include the amplifier in the circuit and connect the antannea but i have basic circuit building knowledge and would prefer to build my own. if there are any low price kits however i would be willing to look, but i want to learn more about their functioning as well.

thanks a lot
-eric

For 25W single band AMPs you could probably get CB transistors to do the job. Try

"A Broadband HF Amplifier using low cost Power Mosfets" Mike Kossor, WA2EBY, QST March 1999, pp40-43 and April 1999 pp43-46. Layout is critical but PCBs available, complete kits in fact...The design is a 28 or 24 volt design but gives 40 to 70 Watts. As a broadband it gives 15w at 12 volts. Very low cost!

FETs may be difficult to get going at your frequencies, EI9GQ has a 30w design for 80m with IRF521's but it seems the layout, and effect of gate capacitance gets hard as the frequency gos up.
http://homepage.tinet.ie/~ei9gq/80pa.html

"W1FB's design notebook" by Doug DeMaw has a 10W linear, pp 158-161

Harry , SM0VPO has a 10 watt linear with PCB artwork on his website. There are a few mirrors so do a google search.

"Solid State Design for the Radio Amateur" by Wes Hayward, W7ZOI and the late Doug DeMaw W1FB. There is a 15W linear on page 67 (Third printing, first edition)

Radcom January 1999 carried an article by Mike Grierson, G3TSO "A Solid State HF Linear Amp"... I only have part 1 in my collection!

There is a HANDs Kit "RTX/AMP broadband 18W amp reviewed in RADIO Communications (RADCOM) January 1995 pp48-49. Uses 2SC1969 low cost CB transistors. Sheldon is on the web
Hands Electronics ,Tegryn Llanfyrnach ,Pembs ,SA35 0BL

E-mail: hands@rf-kits.demon.co.uk

Of Course nearly all (bipolar)Linears are derived from the original Motorola datasheets.
AN762 (140W for 12-14v, buy a kit for abt 100 dollars)
EB63 (ditto)

I just did a web search on AN762 Motorola and got 17 hits
http://www.communication-concepts.com/hfamplifiers.htm is the most useful.

There are also Phillips datasheets on the web, reference not to hand...

My favourite homebrew amp project, some rainy day... would be to parallel up humble BD135's, unique in having a high Ft... the key is that as a TO225 case it is hard to heatsink it... solution is probably to clamp copper bars to a pack of 9 of them, say 3 by 3. A pair of packs would give you the power you need... A bit of a flight of fancy really, but the transisotrs are only 35p each! CB 18W trannies only cost a fiver (5 pounds sterling... that's probably a 8.10247 Euro note to you).

The layout problems at the higher frequencies may be offseted by using more modern transistor packages... There was a german website selling a very nice surface mount PA, forget the url... try www.funkamateur.de

Trouble is it is difficult to get accurate data for using cheap (non-RF) transistors at RF...

Paralleling up two linears appeals to me... switch one off to save power, increase reliability if far from home etc.

Anyway, enough. hope some of the above is useful. Keep in touch

Try Eagle CAD from Cadsoft. When asking about software,
is is always a good idea to mention what OS you are using.

Eagle CAD is available for Windows and Linux.

IIRC the url is http://www.cadsoftusa.com

Their was a complete SS 435MHz speech project in the UK magazine Wireless World a couple of years ago, I have it here (it spanned 2 magazines).

Complete circuit diagrams, construction details, test results etc.

Although I expect the chips to simplify it are around now.

If i can get it scanned in i'll send you the complete thing.

The transmitter is the easy bit, it's the receiver that's the most complicated bit.

>Is anyone experimenting with spread spectrum?

TAPR was. There isn't much activity with them these days. They're looking for a packaged FH setup that they can glom on to.

About five years ago I played with a DSSS setup centered on 52 MHz under an STA that TAPR had requested. We were going to run a BPSK DS rig with the information FM'ed on the sequence rate itself. The sequence was a simple 168 bit thing from the ARRL's spread spectrum handbook.

I had an R2 receiver and an identical LO with a broadband 90 degree phase shift network all set up to track the incoming DS signal with a sort of PLL FM style of tracking. We were having trouble tuning the loop to get it to lock up consistently. Looking back on it, there may have been problems with our phase shift network, but I really don't remember the details that well.

I got busy with other things in my life, including moving to a new house and having kids. Meanwhile the STA ran out before we got our rig out of the shop.

Some day I'll get back in to it, but not before my youngest is out of diapers at least...

I can go lower (in cost) than any of you!

Just take the two ends of the wire, one in each hand, and touch them
together to key the transmitter!!

Done it. It works.

I suppose you could go even lower. Use only one wire, going to
ground, and touch it to the appropriate place in the circuit. Don't
even need a plug.

Even lower.... On a battery powered qrp rig, do away with the expense
of the extra wire (in previous idea) and make/break the ground
connection to the battery with your bare hands. I suppose you could
do this with a high power rig, but you should wear rubber gloves,
which would increase the cost again.

Sorry, Mike - Close but not quite. The top toroid is almost right. However, when winding it, the wire that goes across the diameter should also go down through the opening and then wind *up* in subsequent turns. The toroids you drew have their halves fields opposing each other, not in phase.

I first read of these inductors in Electronics (or Electronic Design) magazine back around 1980. Still a good trick.

Jim Horn, WB9SYN/6

743. FA - Collins 6 Khz AM filter for the 75S3B/C

The rarest and hardest to find of all Collins S-Line mechanical
filters, This is the F455FC60, 6.0 kHz
bandwidth AM mechanical filter. It's in perfect mechanical and
electrical condition and will greatly
enhance your 75S-3B or C receivers AM operation. 6 kHz is the ideal
bandwidth for good fidelity
and adjacent frequency splatter elimination. This filter is a drastic
improvement over the stock dual
I.F. can filters that are normally used for AM. Filter date code
indicates it was manufactured the
17th week of 1965. Buyer to pay with a money order or cashiers check
within seven days from the
end of the auction. $7.00 shipping total includes insurance

Hello guys and girls,

I have what I think are a pair of sub-assemblies from one of the classic old Pye PMR transceivers.

They are marked 'F.M. 2nd I.F. & DISC ASSY 276254'.

I originally bought these at a rally intending to poke the 10.7 MHz IF output from my R7000 scanner into them and widen the bandwidth before the discriminator in order to make a receiver for the NOAA weather satellites. This is because the FM bandwidth of the R7000 is too narrow for the NOAAs itself.

I really need some info on these because it's so long since I bought them I can't remember.

If anybody knows which radio they came out of and/or where I could get a circuit diagram it would be very useful.

Ian: Thanks for the very FB message. I've seen a few of the articles you referenced but most of them are news to me. You have sent me to the stack of old QSTs. The Hands kit idea seems neat. I'm also thinking of using the 40 dollar Ramsey kit amp, 20 meter version. I think I could easily adapt for 17 meters.

I want this transmitter to be able to run at 1 watt and then at about 20 watts at the flip of a switch. I always wanted to be one of those guys who says, "Wait a minute, let me kick in the linyer."

Does anyone have plans, notes, schema for what is know as a Tona Tune (I think BARTG had it in one of the Datacom mags?) or any tuning indicator for RTTY,PSK etc that could be constructed. If anyone has the article on the BARTG mag I would love a copy,scan.

If you "fancied" it up you ciould probably make an iambic as well.
Say,two nails instead of pins. Then slap the clip back and forth between
the nails. Do agree with another that you'd need some kinda "handle"
for comfort's sake. How about an rubber pencil-top eraser?

Greetings,

Bit off-topic maybe. Has anyone here have any knowledge
or experience with the following?

I've heard you can take any of the Ameritron's running the
811's and do a direct swap for 572B's. The 600W goes to 800W
and the 800W goes to 1000W , no other mods needed, no muss,
no fuss. Sounds nice as I'm considering getting an Ameritron in
march, but money is an issue. Most Ameritrons are running about
1.00 to 1.75 per Watt, so I'd like to know if this is true.

TIA,

KG4JBM/ Andrew

Three methods. Go to a lower frequency for your filter, (Hookes law gives you more freedom as you go lower) Pay a LOT more for your filters so the surface finish of the crystals is improved, and use quad hybrid inputs and outputs and a PAIR of matched filters to split the signal between them and gain 3 dB of signal handling. Actually, the mixer is good for any of these and will overload AFTER the filters do. LO phase noise from anything short of a crystal oscillator will kill you BEFORE you overload the filter however.....Either your phase noise or his.

Why would you even bother. Its only a 1dB increase. You can change your coax to 9913 and probably get better results for less money, and improve your receiver input to boot.

Yes, the method used was two identical ladder filters and toroid based hybrid splitters and combiner. This maintains the 50 ohm match at all frequencies for the mixer IF port while also improving the dynamic range of the crystal filter system.

As I recall, there was a reason for the ladder topology being better, something about the ferrite in most tuned filter systems saturating. I am going from memory on that part, but I think that was correct.

He also recommended hybrid splitters and dual RF filters before the mixer to keep 50 ohms at all frequencies while getting good front end selectivity. One of the other problems with most designs is the match for the RF port on the mixer going bad at the LO frequencies.

This RF mismatch usually degrades the mixer performance even though it is on the RF port while a lot of articles mainly discuss the IF port as being the critical match. This same mismatch can, and does, affect double balanced diode mixer perfromance.

==========

While mentioning the LO phase noise problems, that was beyond the scope of the article so no solution was recommended. Improving LO performance

is a massive and complex issue and I can see why he didn't go into it.

Still, the RF and mixer sections he did discuss do indeed offer superior performance over just about all commercial rigs out there. In my case, I live in the silicon valley part of california and there is a LOT of signals sneaking in my antenna line..... Which is why I am taking a hard look at this design.

Seems to me the FCC limited spread spectrum ham experiments to 440 and above. I think they also specifed the allowable PN sequence codes but I am not sure as to that part.

One thing is, they want to be able to listen in and so I can pretty much guarantee that they will limit the choices for what hams can use for spread spectrum stuff.

Hello, I have an old mobile UHF radio that I am trying to get some information on. I believe it to be an RCA series 700 radio. Here is the information I have.

Model CMLL4MMB
Channel Element 3457514
Remote head and mic. RCA is the only thing on it.

I can get some crystals for it (that is how I fould out that it might be a series 700) but I would like to have some more information on it. Would also prefer a manual too.

I have searched the web for quite some time and have been able to find references to it but no pictures and no real information.

Thank you for any help you might be able to privide.

RCA sold out their land mobile operation in 83.

They were big with state agencies out east, you might start by calling Departments of Transportation in PA, NY, NJ; and ask for the chief communications engineer.....my experience is that state agencies keep old manuals/paperwork forever.....

good luck.....that stuff was built like a battleship, it should work if you can find the info.

No. The point is that there should be a code test for the honkies and another one done to a rap beat instead of the cracker-boy-Morse one being forced down the throats of individuals stolen from the dark continent who are still rubbing their chain marks. Kinda like substituting Ebonics for English at the college level. Its a cultural thing, you know what I'm saying?

Sam,

With respect,....

You must not chase much DX or hang out very often on 75/80M
or 160M. Do you really think that better coax is gonna break a massive
pile-up of rich old hams who can all afford Henry 3 or5 KW's ???

If your point is to not forget the total system, I agree completely. I can
think of at least a dozen ways I could improve my shack. But if you're gonna
sit there and tell me that you worked Kingman's Reef on 5 bands on your dad's
old 50W Lafayette rig (or whatever) -- Give me a break. And if you're QRP,
see how many you get if you stop calling "QRP" before/after your callsign.
Likewise for Mobiles. They both succeed just as much by appeal to the DX's
ego as by the calling station's skill.

If you have knowledge you can share about increasing signal strength
then I'd love to hear it. But this thread asks a specific question on amp.
mods. You're talking to the wrong person about any "debate" on the issue
of using linears. I'll take any advantage I can get. And in the world below
4.0MHz -- The more fire in the wire the better.

The idea was in HR for September 1978, recommended by W1JR as a way of winding a coaxial balun on a toroid. However, it may not have been original even so long ago.

That particular balun design used coax with a third wire (if I remember rightly) and the winding method was proposed as a way of reducing end-to-end capacitive coupling. Ever since seeing the idea, I've used it routinely for winding coax on toroidal cores, for RFI suppression or for current baluns, but never noticed that the same principle applies equally well to single wire windings.

Is the increase in measured Q simply due to the reduction in end-to-end self capacitance?

Some new stuff has been added at www.ab7sl.com in the past few weeks....

1. Site search - the entire site is now indexed and searchable from the
homepage

2. Arizona Repeaters Page - covering all repeaters statewide
on ALL bands. Sorted by county,band and frequency.
This added some 20 pages to the site.....

3. Weather Page - shows temps for selected US cities , full weather
conditions
for Prescott,AZ and USA - World weather maps and forecasts...

4. Added a Grand Kids Photos page....they are so cute and adorable!

I suspect you're using a TDMA cellphone and you're hearing the
transmitter switching rate, resulting in the buzz. Other than
shielding the hearing aid with a metal screen over your ear or
finding some way to prevent RF from entering the aid's circuits,
I'd go with an external earphone/mike to keep the cellphone's
antenna away from your head.

The 572 is capable of putting out more power but to do that you need to supply it more power!
Remember that this is an amplifier and if you can load it to put out more power it'll draw more from the power supply.
A little less than half the power will be used up in the plate resistance of the tube and dissipated as heat and most of the rest can be loaded into the antenna. Some of the power will be dissipated as heat in the internal resistance of the power supply.
So if you install 572 and try to load it more, the internal resistance (read capability of the dc power supply) will be the limiting factor. Power output is effiency times volts times amps. I'll bet the that Ameritron didn't leave any reserve in that power supply so you if your that set on it build an outboard supply and put in the 572 and you'll get more power. A 572 can take 2400vdc on the plate and 600 watts whereas the 811 is rated for 1700vdc at 270 watts. The thought sounds good but it's too good to be true so I agree with the previous response to buy better coax and that'll help on rx as well. Two other things you should consider is a good used Heathkit SB 200 or better yet Heathkit SB 220 with 3-500Z . Both are very good amps and very reasonably priced. Drake L7 and L4 are also very good but cost a little more. If you have to have the power find a good Heathkit and you'll be happy.

Hi folks,

I would like to announce that the radio-portal database now contains more than 30,000 hobby related URLs. During the last two weeks I concentrated on collecting URLs for manuals, modifications and reviews, as this kind of information is of special interest for many of us.

radio-portal is a search engine especially for radio amateurs and short wave listeners; it was awarded by Radio Netherlands with the Milleneum Innovation Award in the year 2000.

If you should not find information on a specific model, try a search using the manufacturer's name, and limit the search to the category of interest (like "Modifications", "Manuals and Schematics", "Reviews"...)

His point was obvious to me, why spend a lot of time and a fair amount of money to modify a rig when there are lots of other ways to improve your signal by 1dB which are far more simple. You might argue that 1dB isn't worth it and I would understand, but your flaming a knowledgable person over a reasonable remark.

>
it is 455kHz IF, but not for F30FM according to the handbook, several
others like W15FM Westminster are almost the same in many respects as
the F30FM

found it later, 276254/10 is for 25kHz channels and 276254/11 is for
50khz channels with F60FM, might also be from FM10d Cambridge, it is
quite old, I wouldn't have bothered with it. The first Westminster was
made in 1967, and the revised version is from 68, but the Cambridge
series is earlier, used mainly Ge-type transistors, possibly 1964.
Issue 3 Service manual for F60FM is dated August 1966

We used to go to B. Bamber, also G8AGN at Rugby - where I bought AM25B
and AM25T in '74 (same sort of equpment as the Cambridge) and tried
conversion from AM to FM with boards from B. Bamber

> prescaler and more charge-pump gain....
> <snip>

So, after much late-night tinkering, here are some follow-up results for this synthesizer design (blue), compared to the synthesizer in my Icom R7000 (magenta):

http://209.95.122.40/jm/WIDE.GIF (R7000 'wins' by 7 dB at 10 kHz due to its
cleaner VCOs)
http://209.95.122.40/jm/MEDIUM.GIF (R7000's narrow loop is very noisy close-in)
http://209.95.122.40/jm/NARROW.GIF (R7000 is garbage, while we look pretty
good)

Worst-case lock time is similar for both, although their step functions look
very different:

http://209.95.122.40/jm/TIME.GIF (blue/magenta=R7000 stepping between 770
and 1030 MHz; red/green=DDS PLL stepping between 1000 and 2000 MHz)

In general the ADF4112 doesn't seem any quieter than the LMX2326 I tried earlier. The ADF4112 supposedly allows up to 5 mA of charge-pump gain versus the LMX2326's 1 mA, but I kept running into stability problems at gain settings over 2.5 mA. These plots were made with a loop bandwidth of 2.1 kHz and a charge-pump gain of 1.88 mA.

Still, this is more-than-passable performance for such a simple design! I've never seen a synthesizer with a gigahertz of range and sub-1 Hz resolution that fits into a 4" x 2" Hammond 1590G box before... much less managed to build one. It's less than a third the size of the R7000's 770-1290 MHz PLL assembly, and has 100 times the frequency resolution and up to 30 dB less close-in phase noise.

783. Icom HM-98 modification?

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-26 12:14:23 UTC
From: Jesper <jmandre@bigfoot.com>
Message-ID: <3C529D07.FBF04799@bigfoot.com>
Source record: 46926

I have a IC-2800 in my car with a HM-98 microphone.
I want to use it for local repeater operation, so the 1750Hz
bleep
is used a lot. Unfortunately the built-in bleep is accessed
by pushing
two buttons under the cover of the mic that I usually prefer
to keep on.

The best solution I can think of is to install a separate
1750Hz oscillator
with a new button somewhere near the PTT. Has anyone done
this already,
or are there better ways of doing this?

While at this subject, is there a place on the net where I
can find info on
the serial data format that the HM-98 uses to communicate
with the rig?

Source record: 46929

I found the article about this mixer topology....

It was in 'Commumications Quarterly' Fall 1994 edition

Page 81

This was a reprint from an earlier article which, I think, was in a British magazine.

Oh yes, there is also some information on the mixer in the 2001 ARRL handbook, section 15.28 seems to be the main page to look at.

The handbook does not go into as much information about the hybrid splitters and dual crystal filters and so on, but some stuff on the the mixer itself is there.

Hopefully I'll have a schematic up there before long... it's not a
complex circuit but I don't feel like entering the 80-pin DDS part
myself. Although the ADF4112 is hand-wired (barely visible at right),
the AD9854 is mounted to a cutaway section of one of Richard Hosking's
PC boards, and we've been chatting about the possibility of doing a
board design for the whole synthesizer based on the AD9854 board he's
already done.

I'd certainly like to have some boards made up, because I could use a
couple more of these synthesizers, and I don't EVER want to wire up
another TSSOP package ugly-style.

If that's a limitation you're going to have to live with for a long time, you should look into an FTP client that knows how to resume interrupted file transfers (assuming that the server supports the feature too).

I ->think the FTP client in MS IE5.x can do it, but I don't have the problem myself.

'ARRL Radio Designer' was a cut-down version of much more powerful software called 'Harmonica', but that has now developed and been absorbed into the 'Serenade' suite, which contains both 'Harmonica' and a system simulator called 'Symphony' (are we all keeping up with the music?)

Since the owners of 'Serenade' released a free Student Version that is much more powerful than 'ARRL Radio Designer', ARRL RD has been withdrawn.

There is a link from the ARRL site to the download site for SymphonySV.

Thanks Bert, I have got FtpPro which does have this feature, and I
tried it, but the relevant site would'nt give me access to their File
system.

What happens if you do the download through your browser, rather than a stand-alone FTP client? As I said I ->think that MS IE5.x has the auto-resume feature built in, as does Opera; maybe yours (if it's something else) does too?

A few years ago someone mailed a solution to the following problem to me,
but I have since lost it.

I have a Kenwood TS-520S, and I am wondering if anyone knows how to make a
homebrew power converter for the radio so I can run it from battery power.

Please respond via e-mail as I don't check the newsgroups often.

Thanks in advance,

Brad Sheppard

I know SAM personally and you couldn't meet a nicer guy. I can assure
you that his post wasn't laced with bad feelings or an attempt to incite
anything. I too questioned myself the point of the expensive and
potentially troublesome "1db effort" when I read your original post
before he even replied. Granted he didn't directly answer the question,
but he certainly addressed it and I think the point has since become
clear.
Newsgroup activity is not for the thin-skinned...I don't have to go too
far back into your posts to remind you of that.

I apologize for the tone of my response. I was not trying to "pick a fight", just replied on the fly and didn't have a lot of time to elaborate. I figured I'd make the point without a lot of unnecessary words.

>If you have knowledge you can share about increasing signal strength
>then I'd love to hear it.

That's what I was trying to do. The fact is, regardless of whether you add 1 dB with an amp, or 1 dB with less feedline loss, its still 1 dB. There is no difference. The 1 dB that you gain with the amp is not going to get you through a pileup any better than the 1 dB you gain with less feedline loss.

>Do you really think that better coax is gonna break a massive
>pile-up of rich old hams who can all afford Henry 3 or5 KW's ???

Not any more that increasing your power from 600 watts to 800 watts will.

I don't run an amp here, but I don't feel any way about those who do, either. I have worked a fair amount of DX with 100 watts and rarely am disappointed. That's just the way I operate. I never said anything bad about running power, nor did I say anything about running QRP, Those were your thoughts, not mine.

> the inputs and outputs?

Well, here's the circuit description that I sent to Richard (with a few corrections I've already passed on to him) and additional notes in parentheses. This is the basis for the schematic and board layout he's working on.

------snip email to Richard-----

Basically, I started with the circuit for your (Richard's) DDS board, using an AD9854ASQ chip. (The cheaper -AST chip would be fine, too, since it doesn't need to run very fast, 100 MHz or thereabouts.) It is wired the same as your board (see Richard's board at http://members.iinet.net.au/~richardh/VK6BRO.htm, a steal at US $20 for anyone who doesn't need the full PLL monty!), with the following exceptions:

- The A2IOR line is permanently grounded (there's no need to ever read from the DDS chip, as far as I can tell)

- The CS chip select line, ditto

- Same for FSKHOL and SHKEY

- The comparator circuitry is omitted (R16-R19 and C17, C19)

- The clock is supplied externally through an SMA jack terminated in 51 ohms

- The clock jack feeds the center junction of two 1K resistors going between AVDD and ground via a 0.001 uF blocking capacitor (you may want to make this optional if you wish to include an onboard clock option like you have now)

- The power-supply regulators are replaced with Linear Technology LT1086 chips (just what I had available, yours are fine too, I'm sure) bolted to the 1590 chassis as a heat sink and fed by +12V

- Aside from the usual bypass capacitors, there is a 100 uH RF choke (from Radio Shack) between U2 and the AVDD connection point on the DDS board. At least with the LT1086 regulators, this improves the DDS broadband noise floor substantially.

I didn't need a latch feature for my purposes, so I omitted U5. My 5V-to-3.3V interface is simply the junction of a 10K resistor to ground and a 3.3K resistor to each of the following LPT port pins:

- LPT pin 9 to RESET (DDS pin 71 controlled by printer port bit 7)

- LPT pin 8 to IOUD (DDS pin 20 controlled by printer port bit 6, R9 omitted)

- LPT pin 3 to WRB/SC (DDS pin 21 controlled by printer port bit 2)

- LPT pin 2 to A0/SDI (DDS pin 19 controlled by printer port bit 1)

The output low-pass filters are omitted. Instead, a connection is made from DDS pin 49 (I output at R4) through a 0.1 uF capacitor to the primary of a Mini-Circuits T1-6T transformer. The other end of the primary is grounded. The secondary of this transformer feeds a Toko America SK107M3N-AO-20 ceramic filter (Digi-Key part # TK2307-ND, 10.7 MHz center frequency, 180 kHz bandwidth with Zmatch=330 ohms), which in turn drives the secondary of another T1-6T transformer to get back down to 50 ohms.

The level at the output of the second T1-6T transformer is about -18 dBm. It is amplified by a Mini-Circuits MAV-11 MMIC (http://www.minicircuits.com/cgi-bin/amplifier?model=MAV-11&pix=bbb123.gif&bv=4) with 0.1 uF coupling capacitors on either side, biased by 12 volts through a 120-ohm, 1-watt resistor with a 0.1 uF decoupling capacitor at the power-supply feed point. The level after the MAV-11 is approximately -8 dBm. The coupling capacitor at the MAV-11's output feeds a Mini-Circuits PLP-10.7 low-pass filter (http://www.minicircuits.com/dg02-162.pdf), whose purpose is to get rid of higher-order harmonics and DDS images that the ceramic filter won't attenuate very well.

The output of the PLP-10.7 filter is terminated with a 51-ohm resistor to ground. A 0.1 uF coupling capacitor feeds pin 2 of a Linear Technologies LT1016 high-speed comparator (http://www.linear-tech.com/pdf/1016fc.pdf). This is an 8-pin DIP that serves to convert the filtered DDS signal to 5V CMOS-compatible levels. Driving the phase detector chip with a rail-to-rail square wave is good for 2-3 dB of in-band phase noise improvement, at least with the LMX2326 chip. (I actually don't know if this is still true of the ADF4112, as I didn't try it without the comparator. It seems like a safe bet, though. It might be worth using the AD9854's built-in 3.3V comparator instead if board space is at a premium.)

Pin 2 of the LT1016, the noninverting signal input, is biased halfway to the +5V rail with two 1K resistors in series between power and ground. Another 1K resistor is placed between pins 2 and 3 to raise the inverting input to the same DC level. Pin 3 has a 0.1 uF bypass to ground to keep it from trying to follow the AC component of the input signal. Pins 4, 5 and 6 are grounded, with +5V Vcc at pin 1.

The comparator output at pin 8 (~Q) goes directly to pin 8 (REFin) of an Analog Devices ADF4112 phase-frequency detector chip. The ADF4112 is a 16-pin TSSOP package, available by direct order in small quantities from www.analog.com. The connections to this chip are basically as shown in the data sheet at http://products.analog.com/products/info.asp?product=ADF4112:

- Pin 1 has a 4.7K resistor to ground
- Pin 2 is the charge pump output to the OP27 op-amp, below
- Pins 3, 4, and 9 are grounded
- Pin 5 is bypassed to ground with 100 pF
- Pin 6 is the input from the VCO, below
- Pin 7 is the analog supply (+5)
- Pin 8 is the reference input from the LT1016 as noted above
- Pins 10 and 15 are tied to the digital +5 supply
- Pin 11 is connected directly to the LPT port pin 3 (not through the 10K/3.3K divider since this is a 5V chip)
- Pin 12 is connected directly to the LPT port pin 2
- Pin 13 is connected to LPT port pin 7
- Pin 14 is connected to LPT port pin 15
- Pin 16 is the charge-pump supply (+5)

(To use the more commonly-available National LMX2326 PLLatinum chip, leave out the resistor at pin 1. This requires changes to the control software and loop filter, but I believe the performance will ultimately be the same.)

Between the ADF4112 charge-pump output at pin 2 and the VCO is an OP27 low-noise opamp (http://focus.ti.com/docs/prod/folders/print/op27.html). This is an 8-pin DIP available from numerous vendors at www.findchips.com (although DigiKey seems to be out of stock at the moment).

The OP27 serves to interface the 5V phase-detector chip to the VCO, whose tuning line needs about 18V to tune to 2 GHz. The OP27 is powered (at pin 7) by a +20V power source, decoupled with a 47 uF capacitor and 1 mH RF choke. Like everything else in the circuit, the OP27 needs clean power -- its own common-mode supply rejection is not enough.

The OP27's non-inverting input is tied midway between +5 and ground with two 10K resistors. There is a 0.1 uF bypass capacitor at their junction.

The first and second poles of the loop filter in my circuit consist of two 1-uF polyester capacitors in parallel (at least 35 volt rating needed here, and the caps should be nonpolarized -- no aluminum electrolytics) in series with a parallel combination of a 0.22 uF tantalum or metal-film cap (no ceramics!) and 82-ohm resistor. This filter goes between pin 2 (inverting input) and pin 6 (output) of the OP27.

The loop filter also has a third pole intended to clean up as much of the op-amp's own noise as possible. It consists of a 100 ohm resistor

between pin 6 of the OP27 and the VCO's tuning line. A 0.1 uF tantalum (no ceramics) and a 100 pF silver-mica are paralleled between the VCO tuning line and ground, as close to the VCO as possible.

Some say that metal-film resistors are 'quieter' than carbon-film types, but I never saw any difference in my tests. It might be true for larger values. Carbon-composition resistors are supposedly among the noisiest of all, so try to steer clear of them in the loop filter.

I would suggest leaving plenty of room and ample connection-pad area for the loop filter components, since people like to tweak these. Some builders may want to use smaller capacitors for faster locking, for instance. Same with the VCO... the ADF4112 is usable with any VCO between 100 MHz and 3 GHz, so it would be nice to make it easy for people to adapt the board for different VCO modules.

The VCO is a Mini-Circuits ROS-2150VW (data and pinout at http://www.minicircuits.com/cgi-bin/vco?model=ROS-2150VW&pix=ck605.gif&bv=4). It runs on +5 volts, and its RF output is connected to one leg of a Y-network of three 22 ohm resistors. One of the other 22-ohm "legs" drives a 51-ohm resistor whose opposite end is grounded. The junction of this 22-ohm and 51ohm resistor is coupled through a 0.001 uF capacitor to pin 6 of the ADF4112. Obviously these lines need to either be very short (millimeters!), or they need to be designed as 50-ohm transmission lines, because they carry the 1-2 GHz signal from the VCO.

The final 22-ohm resistor in the splitter network feeds the input pin of a Mini-Circuits ERA-5 MMIC (http://www.minicircuits.com/cgi-bin/amplifier?model=ERA-5&pix=vv105.gif&bv=4) through a 0.001 uF coupling capacitor. The ERA-5 is biased with +12V through a 100-ohm 1-watt resistor and a Mini-Circuits ADCH-80A broadband RF choke (http://www.minicircuits.com/dg02-210.pdf). The RF choke should be mounted directly adjacent to the ERA-5, with the resistor between it and +12V.

The synthesizer output is coupled from the junction of the ADCH-80A and ERA-5 output pin via a 0.001 uF capacitor to an SMA jack. The output level is nominally +11 dBm, varying +/- 3dB between 1000 and 2000 MHz.

That's all there is to it, really, except for the +5V power distribution. I used a 7805 regulator (again, bolted to the chassis to serve as a heat sink) off the +12V bus, which itself came from a 7812. The 7812 also feeds the two 3.3-volt LT1086 regulators for the DDS subsystem.

The output of a 78xx regulator is very rich in broadband noise, so it has to be filtered heavily before being used in a PLL. I used a 1 mH RF choke at the 7805 output, feeding a 47 uF bypass capacitor (tantalum or aluminum electrolytic). There are five more 1 mH RF chokes connected to this node, each with its own 0.1 uF ceramic / 2.2 uF tantalum bypasses to the ground plane. Three of these RF chokes feed the ADF4112's digital, analog, and phase-detector power-supply pins; the fourth

supplies the LT1016 comparator at pin 1; and the fifth supplies the VCO.

Make sure the 1 mH chokes above are rated for at least 100 mA of current. Total current drain on the +5V line is about 60 mA. The DDS subsystem will require about 400 mA at a clock rate of 100 MHz, when configured with my software (Q DAC, comparator, and sinc filter turned off).

At first, I tried running the "master" 7812 from the same +20V bus that feeds the OP27, but it just generated too much heat. So I added a second feedthrough cap to my chassis, and ran +15V to the 7812 and +20 to the OP27 (+24 is fine too, but +18 may not be enough to tune the VCO to 2 GHz reliably). The chassis still runs warm (probably ~40-50C), but not burning hot like it did with a single +20V supply.

----------end snip----------

>
> What kind of vco are you using? You didn't mention this so far.

See above. Usually, good engineering practice in a PLL with this kind of coverage calls for two or more high-quality VCOs for reduced tuning sensitivity and (consequently) lower phase noise outside the loop bandwidth. That's what the R7000 receiver does, which is how they're able to pull ahead of me in the wideband phase-noise plot with up to 7 dB better PN at the all-important 12.5-kHz channel-spacing offset. But that would complicate the design substantially, and for my application, it just isn't worth the hassle for the difference between -105 and -98 dBc noise levels.

If you need better noise performance, you would want to start by upgrading the $30 Mini-Circuits VCO, either by splitting the coverage range across multiple VCOs or by using a quieter, more expensive part (like a surplus YIG oscillator). The VCO is definitely the weakest link in my design.

After that, a narrower DDS filter (say a +/- 15 kHz-wide crystal filter) would bring a further improvement in both SFDR and broadband noise.

Finally, it might be worth looking for a quieter op-amp (or a discrete-transistor charge pump amplifier as suggested by Dean Banerjee at NSC, something the Icom people used to good effect with a JFET current source). Watch out for opamps that seem quiet in the nV/root-Hz department but have a high input current spec that will load the phase detector, though.

The reason for the vertical shield and 4 feedthrough caps in my chassis
was to keep any digital hash on the parallel-port lines as far away from
the PLL-VCO path as possible. I probably went overboard with that... at
any rate, RF decoupling of the digital control lines can be left off the
board and up to the individual builder.

Why don't you just surround the DDS chip and its associated filters with
a "firewall" of adjacent pads that are connected with vias to the ground
plane? That way, if it turns out we need to physically wall off the
digital components from the rest of the PLL, it'll be easy. Otherwise,
no harm done.

Many folks (that do not subscribe to this NG) don't realize how important the feedline is.
Not to mention that a 1dB loss is a
direct hit to the receiver's noise figure, which cannot be made up with an amplifier.

Reminds me of a 2 meter repeater that was interfering with our HAM club's repeater.
The repeater's output was 100W, and the person responsible for it agreed to lower the
power by 3 dB. But when we talked "watts", he said he could lower the power by 3 dB, but
refused to lower the power from 100W to 50W ! :-)

Interesting design point: I've always found it much easier to throw in additional shielding and decoupling at the design stage. We never actually know whether all of those extras are going to be needed, but as JM says, they do no harm. But they do increase the chances that the circuit will work well, first time.

In amateur radio, I value my time a lot more than the cost of the extra small components. My first priority is always to get the project successfully completed, because the "wanna do" list is always growing!

I was going to say that "Obviously this isn't a cost-effective way of designing commercial products", where component and assembly costs can add up over long production runs - but as I write, I'm realising that isn't necessarily true. In the control boards that I sell for amateur power amplifiers, I've designed in lots of protection against external RF fields. Many customers will not need all of that protection... but there have been no callbacks about RFI problems, so maybe over-design was a good commercial decision too.

John,

Very interesting design with current nify chips.

So on the ADF4112, you dead-bugged the TSSOP package for your prototype? (I assume that means glue the chip with legs up and solder wires to it.) No wonder you don't want to do that again. Just curious what gage wire you were soldering to the chip. I would think even 30 ga would be big to solder to a TSSOP package.

One small question, below, on your description of the circuit.

Thanks for sharing,
Rex, KK6MK

Was the 1-watt a typo? Seems excessive for a MMIC, but with 12 V
feed maybe you need at least 1/2 watt.

Hi Jim,

Thanks for the excellent info. You have a thoroughly professional
design, and I am anxiously waiting for the schematics and more info.
In the meantime, I collected some information that may be of interest
if you haven't come across it already. Here's a copy-paste from my
notes:

On reducing regulator noise, Wenzel has some comments on "Finesse Voltage Regulator Noise" at

http://www.wenzel.com/documents/finesse.html

Fred Walls uses a Darlington configuration in series with VCC with bypassing on the base in "Guidelines for Designing BJT Amplifiers with Low 1/f AM and PM Noise"

http://www.boulder.nist.gov/timefreq/general/pdf/1139.pdf

There's some interesting articles on reducing synthesizer noise listed in "NIST Time and Frequency Publications"

http://www.boulder.nist.gov/cgi-bin/showpubs.pl

Many of the articles are dated but still of interest.

Ulrich Rohde shows a neat trick for reducing oscillator flicker noise in Fig. 15 of "Oscillator Basics and Low-Noise Techniques for Microwave Oscillators and VCOs"

http://www.synergymwave.com/publications/PDF/Oscillators.pdf

He claims a 15 dB reduction in close-in noise using the tecnique in "Analyze VCOs And Fractional-N Synthesizers", which used to be at

http://www.mwrf.com/2000/aug1500/057-078.html

but that url is no longer valid. Also, the idea is probably patented by now, but individuals can try it for experiments.

Adding DC stabilization would mean removing the can of the Minicircuits vco, but it might be worth it!

Regards,

Mike Monett

Are there any books dedicated entirely to construction techniques? I don't seem to be able to find that sort of thing. I'm wanting a book or whatever, that will cover point-to-point wiring, chassis construction, PCB construction etc. Any good links to articles on the web even. (I have some). I've got components ready to go, but I need to settle things on the mechanical side as to how to build my tube and solid state projects. Anybody employ filing cabinets? Thanks. Rich.

It's not so much a dearth of material relating to PCB construction, as to other issus such as material about chassis construction techniques or ideas. That's why I mentioned filing cabinets. I'm wanting to build every major project in the same style of chassis I think, so everything matches. I was thinking about chassis size that goes with 19" rack mounted equipment. Can you buy that size of box chassis. I don't seem to have come across anything for sale. Then again I could make my own chassis, but I'd need a jig I think, some kind of former/bender. Then again I could pick out a filing cabinet size and design around that. I'm just looking for ideas really. My first projects are tube based Rx Tx.

==========
Have good look on flea markets ,not necessarily related to
radio equipment but also related to computers and general electronic
'junk'.
I found an old PDP-11 machine in its 19 inch housing and stripped the
cabinet.
From the elements you can build a custom cabinet for whatever purpose.
19 Inch cabinets are also used for fire alarm systems etc. I am sure scrap
yards
are also a potential source for this type of material

Good Luck

There is this problem though if I want things to match. I have 3 table-top cabinet shells from:, a marine radiotelephone (Ajax), Hallicrafters HT32 (nice) and (potentially) Labgear LG50, . Then I have a 19" cabinet 38" tall. All completely different!! Reproducability at any time in the future is important to me. Thought about getting a few HT32 cabinets, but not easy I don't think. Especially from within UK. Anyone in UK got any?

Why use the ad9854 agn?, would the 9852 do the job?

and for 100MHz clock the 9850/1?

or is this using the quadrature outputs?

825. Help Identify Tubes

Source record: 46867

Hello, All,

I have two tubes made by Amperex and wonder what they are and what they are good for.

My guess is that they are either power tubes of some sort or microwave.

They have an unusual shape, with 2 terminals out the top if I remember correctly.

They are numbered 8683 and 7377.

Thanks for any advice.

Clyde

easy
> I don't think. Especially from within UK. Anyone in UK got any?
========
If you want a custom 19 inch rack type cabinet , find a scrap cabinet
(taller than the one you want)
of the modular variety.
Take it to bits and trim the components to the size you want ,both height
and depth.

Example :The cabinet for the old PDP-11 I have is too high for the operating
desk I wish to put it under (on castor wheels) , hence I'll cut the 4
vertical supports (with recess and holes to fit (a) 19 inch panel(s)) and
the cabinet sides /top and bottom will be cut to size in a sheet - metal
workshop, resulting in a taylor made enclosure !
Even without an old 19 inch rack type of cabinet ,you can construct a
taylor-made cabinet by using heavy duty angle steel used for storage racks
etc.

831. Fireworks and 3-500Z

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-27 19:22:14 UTC
From: "Al Lorona, Jr." <al_lorona@agilent.com>
Message-ID: <3C545365.55186441@agilent.com>
Source record: 46887

Hi, Everybody,

An Eimac 3-500Z with a total of fifty hours of service on it was recently powered up in an amplifier which had been packed away for three-and-a-half years. Surprisingly, arcing inside between the anode and ground repeatedly shut down the plate supply.

I let the filament cook for 48 hours (with the plate supply disconnected from the tube). Reasoning that gas was causing the arcing, this was a desperate attempt to activate the getter and get rid of the impurities. The tube got to the point where it could support the plate voltage, but as soon as drive was applied the tube arc'ed and shut down the high voltage again.

Am I hosed, or is there something else I can try?

Thank you,

Al W6LX

832. Power Supply

Newsgroup: rec.radio.amateur.homebrew

From: Robert Offer <robert@g1zjp.freeserve.co.uk>
Message-ID: <a31l3iutc1@news6.svr.pol.co.uk>
Source record: 46872

Hi all,
I have just purchased an ex-military EHT supply with a model ... No.50 on it. It looks to have a choke input, a fairly large transformer and a couple of brown "potted" type of rectifier blocks.
Does anybody have any kind of information on the supply or any idea of the output of the transformer? There do not seem to be any markings on any of the kit. Same with the paper capacitors (2of) in what was described as the "low power/voltage bit".
Any help much appreciated
Thanks in advance
Bob

> Why use the ad9854 agn?, would the 9852 do the job?

The 9852 would be fine, too. The 9854 is just what I had in the junk box. It is pin-compatible with the 9852, so either chip would be OK to use. I don't know if the pricing is any different.

>
> and for 100MHz clock the 9850/1?

Have a look at the narrowband SFDR plots on their respective data sheets. Remember that the "grass" within a few kHz of the carrier will be amplified by as much as 40-50 dB (20*log(total N)) by the PLL. The 9852/9854 have 12-bit DACs with 17-bit internal phase accumulators, so they're theoretically 6 dB cleaner than the cheaper 10-bit parts... but from the spectral plots in the data sheets, the differences in overall noise/spur content look even more dramatic. PLLs like clean references!

As usual, for most applications the extra noise may not be a big deal, but I'd rather spend a few more bucks and be satisfied that I've used the best part for the job. I guess that's why I don't do this for a living. :-)

Last I checked, The Go!Zilla package contained spyware which it
installed on your system. I got it off my machine after I found
this. It also never successfully fixed a broken download for me.

Here's a link to software that scans your machine for spyware:
www.lavasoftUSA.com (Ad-aware)

Now that is a neat hack! It's a shame they don't build 3-terminal
regulators with that technique built onto the die, where it (seemingly)
would belong.

Exactly. You can barely see the 4112 just above the leftmost of the two bright yellow polyester caps. The chip is held down by its three grounded pins, no glue necessary.

> No wonder you don't want to do that again. Just
> curious what gage wire you were soldering to the chip. I would
> think even 30 ga would be big to solder to a TSSOP package.

I used 30-gauge Kynar wire-wrap wire.

The trick seems to be to bend alternating pins on the chip in opposite directions to give yourself some room. You get to do this once, maybe twice, before the pin suffers too much fatigue and goes all floppy on you, so it pays to start by bending the ground pins down towards the board. :)

Tin both the chip lead and the wire, and then -- remembering to clean the soldering iron tip before every connection -- lay the wire end atop the chip pin and heat it with the iron until you think the solder coatings might have melted together. You can verify the connection to some extent by wiggling the wire at the point where it lies atop the pin with a very fine pair of tweezers. After that, you don't want to move the wire around any more than necessary.

You want to keep plenty of fine-grade solder wick on hand, of course.

> Was the 1-watt a typo? Seems excessive for a MMIC, but with 12 V
> feed maybe you need at least 1/2 watt.

The MAV-11 draws about 60 mA at 5.5 volts. (12-5.5)/.06 is 110 ohms, rounded up to 120. .06*.06*120 is a little less than 1/2 watt, rounded up to 1 watt for safety. Actually the prototype uses a 330-ohm and 180-ohm parallel combo, the former being visible just to the right of the two dark yellow T1-6T transformers below the DDS chip.

The other power-hungry MMIC is the ERA-5 that follows the VCO. Interestingly, now that you made me go back and check :), it looks like Mini-Circuits has derated the ERA-5's current spec since I printed my copy of their data sheet a few years ago. They are now calling for 65 mA at 4.9 volts typical, while my old data sheet says 80 mA at 5.0 volts. So my 100-ohm bias resistor on the ERA-5 is not as conservative as I thought.

It may be a good idea to use the same 120-ohm 1W resistor on the ERA-5 as on the MAV-11, although I'm not about to dig back into my own unit and change it. The ERA-5's maximum rating is high enough (120 mA on both data sheets) that I'm not too worried about the difference between 65 and 80 mA.

My son has got himself involved with a school science project in which he decided that he would prove that a Bayliss FreePlay generator could power low voltage lightbulbs, buzzers etc.as well as the radio. Unfortunately, neither of us has any useful knowledge of electronics and cannot make the lights etc. function when simply connected to the generator output terminals. Can any one help with this problem using real simple instructions? I would be very grateful for info.Thanx. WH

Wenzel comes up with some great stuff! But few people are interested
in low-noise supplies.

Here are some updates on low-noise regulators that I didn't include
since I could not verify the urls.

I once saw an article that showed the output impedance of the 78XX
regulator has a small inductive component. I can't find the article,
but I seem to remember than a 10uF tantalum on the output caused a
resonance. This increased the output noise significantly between 1
KHz and 100KHz.

The solution was to use higher or lower values of capacitance to
avoid resonance. I'm still looking for the app note.

The 7805 is spec'd at 40uV of noise between 10Hz and 100KHz, where
the venerable 723 produces 2.5uV between 100Hz and 10KHz with a 5uF
bypass at the CREF pin.

A Synergy Microwave article uses a 723 driving a PNP pass transistor
to reduce the output noise. The article has been upgraded to Acrobat
4, which I cannot read using Win 3.11. Hopefully, the regulator is
still shown in Fig. 5. It looks quite nice, since it drives a 22uF
output cap from the collector of the pass transistor.

http://www.synergymwave.com/products/synthesizers/synthesizerpdf/SynthesizerTutorial.pdf

Here's another low-noise regulator that drops the noise to 3nV/Hz at 1KHz:

http://archives.e-insite.net/archives/ednmag/reg/1997/010297/01di_03.htm

Also, Bob Perrin points out the LTZlOOO voltage reference has a phenomenal temperature stability of 0.05 ppm/C. It has an on-chip heater resistor and temperature sensor (base-emitter junction). It might be worth looking into for a stable reference for critical applications.

Regards,

Mike Monett

John, I've been given to understand the ERA-5 has had some heat problems with the power spec'd and the physical package the part uses.

We switched to the GAL-5 which has equivalent performance, but a much better construction for getting the heat out of the device.

Mini-Circuits recommends the GAL for any new designs, and you may want to alter the design for this part. It's physically different, but in terms of cost and performance, it was pretty much a drop in replacement with better reliability.

Actually, I think the GAL was a fraction cheaper cost...

I'll add those links to my collection (Win 3.11?! Wow, that's stoicism for ya!) I would like to find a quieter regulator solution for this type of circuit at some point. Seemingly the RF chokes are taking care of any power-supply noise problems in the present design, as I don't see an improvement when running the +5V line from a separate, known-quiet supply, or when temporarily bridging a 1000 uF cap across it.

Good to know, Jim, thanks! I'll have a look at the new part. The ERA-5
certainly does run hot when you bias it to 80 mA. Hopefully we're OK
using a larger bias resistor.

For some reason, when I type GAL-5 into the minicircuits.com search
page, I get a popup Javascript box that says "Please try GALI-5."
GALI-5 brings up the specs on the part you're talking about (I assume),
but it's not listed in their catalog pages.

Pretty typical, just as I restock my parts bin with 20 ERA-5s...!

I'd like to get my feet wet in UWB, but I'm not sure where to start, to be honest. The two "secrets" seem to be the pulse-position modulator (which has to generate subnanosecond-wide Gaussian monocyles spaced at irregular intervals plus optional small offsets in time for each individual pulse) at the transmitter side, and the temporal correlator ("Fullerton correlator," whatever) at the receiver end.

What I've never been able to wrap my mind around is how the initial link negotiation happens. When you have no idea (a) when a pulse is going to arrive; and (b) where it fits in the PRN temporal spreading sequence, how in the world do you "receive" it?

Yes, Win 3.11. No worries about viruses or trojans, since they won't
run. In fact, the virus checking programs won't run either, so I save
a lot of time not having to keep up with the latest versions :)

Windows loads in less than 4 seconds on a K6-450 MHz, so I get back
online faster after it crashes. And I don't have to reformat my hard
disk and reinstall it every three months :)

BTW, the LTZ1000 voltage reference is vast overkill for a
synthesizer, since the loop has to lock regardless of temperature
drift in the varicaps. The spec took a while to find, since ENGINEER
Bob misspelled it.The data sheet is at

http://www.linear.com/prod/datasheet.html?datasheet=141

Sounds like regulator noise is not a problem in your current design,
but wait till you get your hands on a cheap surplus YIG!

Well the first thing i would do is test the voltage cooming off of the generator... you can do this with any common digital voltmeter. This should give you an idea of what you have to work with... (You may not have much i'm sure alot of the internals of the radio are passive and that the generator may be used to powere the audio amp only...) Once you know your voltage try and find a lamp that will run on that voltage... You may be stuck running a low power led vice conventianl lamp.

> bypass at the CREF pin.

All regulators appear to have inductive output impedances, just as
do all opamps in closed loops. This is because the regulator's
moderately-high intrinsic open-loop output impedance is reduced to
a respectably-low impedance by the regulator's negative feedback.
But this negative feedback necessarily decreases with increasing
frequency, so the output impedance rises with increasing frequency,
which is the characteristic of an inductor.

The NSC 7805 data sheet shows this effect in a graph on page 8,
where Zo is 8 milliohms up to 1kHz, and starts rising 6dB/octave
with an apparent inductance of L = 0.023 / 2pi 10kHz = 0.37uH.

This would resonate with a 10uF output capacitor at 83kHz, but
at 83kHz 0.37uH has a resonanct impedance of only 0.19 ohms, and
a 10uF aluminum capacitor is likely to have a higher esr than 0.2
ohms, so there's really no Q in this "resonance." A 1000uF low-esr
electrolytic like a 10V Panasonic FC type (0.065 ohms) resonates at
9kHz with Q = 2pi 8.3kHz 0.37uH / 0.065 = 0.3, illustrating how hard
it is to show any real resonance effect in most regulators. In this
way the "high" esr of the output electrolytic plays an important role
in closed-loop stability.

854. Tubes for sale

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-28 15:04:56 UTC
From: w4th@hotmail.com
Message-ID: <dc97c428.0201280704.37961b04@posting.google.com>
Source record: 46895

I have new factory fresh 3-500zg tubes for sale. These tubes are
fully tested before they are shipped. I stand behind every tube i
sell. If you would like to see some references about my tubes and
service, just go to my web site http://www.tomstubes.com
and look for the reference section near the bottom of the page.
My 3-500zg tubes are really great. I have sold dozens of these, and I
have never had to replace a single tube! As I said, each tube is fully
tested and that is the only time the tubes have been removed from
their factory shipping boxes.
The price of my 3-500zg tubes is $110.00 plus shipping. I will
warranty each tube for 6 months.....no ouestions asked....If you are
not completely satisfied with any tube you buy from me, send it back
for an exchange or refund....your choice.....no hassle.
I also have 4cx800a tubes new in the box for $190.00 per PAIR!
Thanks for your time and 73.
Tom.......W4TH

856. TS50 SW-RX/TX antenna tuner interface protocol wanted!

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-28 16:13:49 UTC
From: Markus Wolfgart <markus.wolfgart@dlr.de>
Message-ID: <3C5578BD.E49E9EF6@dlr.de>
Source record: 46797
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.homebrew

Hi ngr's, hi om's and (x)yl's,

I'm looking for the specification of the antenna tuner interface
of the Kenwood TS50 amateur-radio transceiver.
The tuner terminal connector consist of five pins:

antenna-tuner-connector (front view)

```
+---+---+---+
| 1 | 2 | 3 |
+---+---+---+
| | 5 | 6 |
+---+---+---+
```

When the transceiver is switched off but connected to power supply
(+13,4V) the pins have
the measured voltage values:

Pin 1: +0,6V
Pin 2: 0V
Pin 3: 0V
Pin 5: 0V
Pin 6: +13,4V

When the transceiver is switched on (RX-Mode) the pins are in the
following condition:

Pin 1: +0V
Pin 2: +5V <-- this voltage (+5V) could be tied down by a 1 kOhm
resistor to 0,8V
Pin 3: +0V and by a 500 Ohm resistor to 0,4V.
Pin 5: +0V
Pin 6: +13,4V

During the power-on period, some dynamic condition appear on pin 1 and
2:

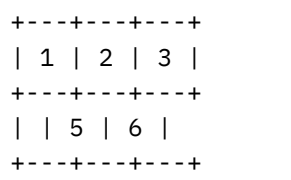
Pin 1: goes up to +5V for 1.2 sec and then down to +0V for ever until
switching the transceiver off, independent of pressing the
antenna tuner push button at the front panel.

Pin 2: goes up to +0V for 150ms and then up to +5V for the rest of the
time.

I want to get the frequency/band info and hope this information is
reported
to the tuner-interface.

Have you any hints for me, concerning this tuner interface.

PS: in the service-manual kennwood call the pins:
TT and TS, seems to be bidirectional and connected via biderectional
drivers
to the M37702M4A 16-bit CPU (i/o port P8)



Pin 1: GND (digital ground ?)
Pin 2: TT ?
Pin 3: ATG (antenna/analog ground ?)
Pin 4: TS ?
Pin 5: 14S (power supply)

Many thanks in advance

Markus Wolfgart

Read my post closely: We were working under a Special Temporary
Authorization from the FCC.

> One thing is, they want to be able to listen in and so I can pretty much
>guarantee that they will limit the choices for what hams can use for spread
>spectrum stuff.

What good is sending a signal that nobody can copy? Yes, we actually
used one of the FCC's recommended Sequencies because we were not
interested in playing with sequency as much as just getting the damned
thing to work first.

Spyware is the generic term for software that is often installed on
your computer via Java scripts. It reports back to the sponsors
information about your browsing and buying habits. It can also have
more nefarious uses, such as recording keystrokes and reporting them
back to whomever launched the program. This is useful for stealing
passwords and etc. It is the ultimate "black-bag" job because it
doesn't even require physical penetration. Use a firewall, get a good
anti-virus package and use ad-aware to detect and delete spyware.

860. TS930S Tx problem

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-28 17:22:58 UTC
From: Jungwoo Lee x5362 <jungwoo@lucent.com>
Message-ID: <3C5588F2.7F050EB9@lucent.com>
Source record: 46800
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hi Group!

I would like to ask a question about my TS930S problem.
It has a terrible audio report (heavy distortion) from QSOs. The problem occurs on all bands
(form 80 to 10m) Initially I thought
it has a RF feedback problem, but I noticed that the previous owner already added the
modification (ferrite bead into the mic circuit, and also a modification in the external
speaker jack) according to the Kenwood service bulletin.
I am beginning to suspect that there may be some other problem (may be final amp stage?).

By the way, when I monitor my Tx signal (by turning on the monitor switch), the tone quality
seems to be OK. So I suspect that there may be a problem after the IF stage
because the monitor function demodulates the IF output signal. I wonder
whether you have any tips about where and how to fix this.
Your help will be greatly appreciated.
Thanks.

Hi Gus,

You have a classic Series 700 radio which is actually a pretty nice unit. RCA had the 1000, 700 and 500 series of the same family. Your radio will do full duplex and that means you can turn it into a nice repeater or duplex link radio. The hard part is buying the crystals, I use Bomar most of the time now (for cost reasons), but ICM also can set you up.

I still have a few RCA repeaters and the mobile radios in Ham/Amateur service. They just wont die... so why replace a good unit.

The best place to find manuals for old RCA gear are the Ham Swaps... Although some Mags claim to have old Service Manual Dealers, none have ever been able to supply me with anything that old, of which I have inquired.

So all my books came from flea markets and surplus two-way radio dealers.

You can compare the 700 to a GE MVP, but the 700 is/was a trunk mount unit. Motorola's equiv at the time was a Mocom 70 or similar.

Just call Bomar and give them them the model and frequency information you have. Most of the Crystal Companies have been dealing with two-way radio so long, they already have the information for each radio channel element in their files.

The manual is the hard part... If you get in a pinch, you can Email me and I'll try to provide additional information. I do know a few places you can still inquire for RCA books.

Cheers

Hi Folks, its Theory time :-(

Assume I have a two plate air spaced capacitor, dielectric = 1.
I then place a thin sheet of dielectric = 2, of the same area as the plates in the airgap, but not displacing much of the air (eg gap = 5" and the sheet = .1").
Will this increase the dialectric to 2 and therefore increase the capacitance ?

And secondly, does the calculation in the ARRL Handbook for calculating capacitance of two parallel plates (ARRL 1990 2-14)hold good if the plates are concentric tubes ?

A silly question, but its got me confused :-(

Win,

The negative regulators - 79xx, LM337 - will oscillate if
insufficiently bypassed. I've bypassed them with just a few hundred nF
of ceramics, and that didn't work... nice sawtooth oscillators.

John

If I understand the question there is still a lot of air space between the plates. YOu will have to take into account the ammount of air plus the ammount of the thin sheet. As the air gap is much greater than the sheet, the dialectric constant will not be much over 1. You have to take into account the total material between the plates.

For the second part, you use the area of the outside of the inside pipe for the area of both plates.

SELL: Ferris Instrument Co signal generator. Vintage age. Appears to be the granddaddy of the Boonton gear as also manufactured in Boonton, NJ and looks exactly like their product style of the 1930-40's

Model: 18-D, freq range: 8 - 210 mhz, 0-1.2v RF output.

Excellent condx, has all tubes, unmodified, original AC cord, atten. pad & cable. Guess to be from the 1930's.

Best reasonable offer. Buyer pays shipping and any "out-of-pocket" packing expenses (no extra charge for packing - if we can find a suitable box - and taking to shipping point of your choice (postal or UPS).

Clearly marked in the data sheets too. ;-) It's probably up there with assuming the pinout is the same as the 78xx far as common mistakes go.

Why is it that the neg regulators (and LDO regulators, in general) need output bypassing to be stable, while 78xx are stable with no bypassing on the output?

That's easy to understand. Ordinary regulators have the equivalent
of emitter-follower or source follower outputs, with a stage gain
of near unity more or less independent of load. There's only a
moderate phase lag associated with the output capacitor.

In sharp contrast, LDO and negative regulator output stages are like
common-emitter amplifiers, with the output capacitance acting as the
load. This means the stage gain is rather high (especially high for
low load conditions) and falls with frequency, due to the output load
capacitor's falling reactance. Furthermore there's a large phase lag
associated with the output capacitor, in fact the feedback circuit can
be thought of as type of brute-force compensated amplifier. So we see
the output capacitor is a critical element in the loop's compensation,
which is not the case for ordinary 78xx type regulators.

Thanks,
- Win

Thanks, that makes perfect sense. I note that the LM2940 is much noisier
than the 78M05, 150uV typical (Co = 22uF) vs. 40uV typical (Co = 0.1uF).

Best regards,

> 5" and the sheet = .1").
> Will this increase the dialectric to 2 and therefore increase the
> capacitance ?

It _WILL_ increase the capacitance, however it will NOT increase it to 2.

Starting with your original air-dielectric capacitor with k=1, and distance between the plates d=5.00cm (units changed to mesh with SI), we then add a dielectric film of 0.10cm with k=2. For the sake of simplicity, we say the dielectric is placed directly against one of the plates.

What we now have can equivalently be described as two parallel plate capacitors connected in series: Capacitor C_1, being defined with k=2 and d=0.10cm, and capacitor C_2, being defined with k=1 and d=4.90cm. This is permissible because there is _NO_DIFFERENCE_IN_POTENTIAL_ between the virtual plates ending C_1 and beginning C_2.

```
|X | |X| | |
|X | |X| | |
-|X |- becomes -|X|---| |-
|X | |X| | |
|X | |X| | |
C_1 C_2
X: k=2 dielectric
```

Now it's time for the formulas [C=(k*e_0*A)/d]
C_1=(2*e_0*A)/(0.10cm)
C_2=(e_0*A)/(4.90cm)

Combining the capacitors in series, we get:

```
1 0.10cm 4.90cm
- = ------- + ------
C 2*e_0*A e_0*A
```

Which solves down to

```
e_0*A
C = ------
4.95cm
```

We know that the capacitance of the above equivalent _MUST_ have the same capacitance as the original, unlike-dielectric capacitor. Since C=(k*e_0*A)/d, and the original d=5.00cm, we can deduce the following relationship:

$$\frac{e_0 * A}{4.95\text{cm}} = \frac{k * e_0 * A}{5.00\text{cm}}$$

Which, when solved for k, gives us an effective dielectric constant of 1.01.

Sorry for the diatribe, but I remembered the question from my freshman physics. Hope it helps!

The 723 is definately the way to go for the best low noise regulators. Bypass
the internal reference before connecting it back to the difference amplifier.
Use these at work for state of the art low noise oscillators.

Actually, Jake, I had noticed that... My post wasn't meant to be about your project, but rather general info for hams who are just starting to read about spread spectrum in ham radio.

The FCC grants a number of STA for experimental purposes, but those privledges are for the specific people it has been issued to. The general public still has to comply with the rules.

==========

By the way, I did a little tinkering with direct sequence at a company I worked for and we found locking up to the signal transmitted to be complicated. Especially if there was any real difference in the frequency of the reference oscillators. For that and other reasons, we decided to make ffrequency hoppers instead.

This was in the ISM bands and quite a few years ago now. We did make a commercial product out of it, but data latency was a problem. I sometimes think we xhould have chased DSS methods after all. Oh well...

> ("Fullerton correlator," whatever) at the receiver end.

While it's not LEGAL yet (and surely "never" will be for hams ...
though the FCC has an NPRM out on rules for unlicensed,
Part 15 like use), UWB is interesting ... I've been studying
it a bit on the professional level.

The PPM version seems vastly inferior to the technical approach
taken by XtremeSpectrum, who use a PN-coded series of biphase
wavelets ... this offers a MUCH lower peak-average ratio than the
PPM version proposed by TimeDomain ... and appears to be a
MUCH better choice, both in terms of coexistence and suitability
for (short range) communications applications ...

Check out Xtreme's website for more info ... don't have the URL
handy on this machine, but any search engine should find it for
you easily.

Hi Win,

Thanks for your explanation. It is not clear from reading the data sheet that the output impedance is inductive, or why ESR plays such an important role.

NatSem has a new app note that might be of interest. It explains the Bode plot of conventional and LDO regulators, and discusses ESR in

some detail. It's at

http://www.national.com/an/AN/AN-1148.pdf

Your explanation is good, and may explain why the rms noise increases when tantalums are used at the output.

The article I am searching for actually measured the noise using different types of capacitors.

I suspect it was EDN, and got over 400 hits. Going through them one-by-one is taking a long time :)

Regards,

Mike Monett

HI, Just seen an R-1155 in an auction and under the Auctioneers hammer tonight.
It appears to be complete, original, unmodified. It seems to have been stored in a dusty loft for 40+ years, it's covered in dust but the knobs are all there (I think they are original but not certain), the DF switches etc. also present and intact, the case appears to be aluminium but not sure on this, there are no mods I can see.

Whats it worth?

If you want it I'll be happy to bid on your behalf, e-mail me with your top bid.

No commision and delivery at cost.

The Hammer falls at about 19:00 GMT tonight so I'll be reading any replies to this message no later than 18:15 GMT.

From: SideBand <ab8lr@csotbs.org>
Message-ID: <3C56A9BC.9090308@csotbs.org>
Source record: 46821

Hello OM's...

I've recently decided it's time to build an amplifier for HF. I'm not a rich man, so I'm looking to do this as low cost as I can. I'm also very unfamiliar with the territory I'm thinking of venturing into now.

I've decided to start with a couple of burnt out microwaves for the power supplies. I figure the transformers in them should be enough to run a semi-large single tube, or two smaller tubes.

I've also (almost) settled on the Svetlana 4cx800A, or two Svetlana 4cs400A's.

The problem here is that I'm in VERY unfamiliar territory. Does anyone know any sources, online or otherwise, where I can get sample schematics for a simple one or two tube amp? How about a source for the calculations necessary to make this project sing without alot of distortion or by-products, and to prolong the life of the tube(s)?

I'm not looking for full legal limit here... 600 watts would be more than enough, and 1200 would be dreamy in my particular situation.

Thanks in advance for your time and consideration.

And following that project, I did post comments to the FCC about the use of Spread spectrum experiments on ham radio bands relating to just what you mention. Unfortunately, the ARRL carried much more weight on this issue. I would have liked to see the sequency options opened up to all walsh codes below a certain length for a given rate. That way, it ought to be possible to lock up on an unknown signal within some given time.

> By the way, I did a little tinkering with direct sequence at a company I

We got around that problem by deriving our chip rate from the center frequency itself. Thus, if you locked on one, you'd be locked on the other.

> This was in the ISM bands and quite a few years ago now. We did make a

Some day, we'll get back in to it. I know a guy with a screen room where we can fool with this stuff as much as we want. When we get something working, we'll probably apply for an STA...

Hey, we were serious about getting this to work. The idea was to see
if we could try a little NBFM on the one VCO we were using to generate
our DSSS carrier. We would recover the signal and watch our VCO
steering line for the modulation...

>: Some day, we'll get back in to it. I know a guy with a screen room
>: where we can fool with this stuff as much as we want. When we get

We had notions of building an orthogonal sequency transponder. I have
doubts as to how much process gain we could get and how much immunity
we could achieve from the repeater's orthogonal code, but we thought
it might be fun to try...

In any case, if you look up my call sign you'll see I live in central
Maryland, between Baltimore and Frederick.

Well, Gold Codes appear to be the fad-of-the-moment _and_ very
useful for fast acquisition and lock-up. My knowledge, at this
time, is pretty much limited to what I can pull out of Dixon and
what I can pull off the 'Net, and to my military experience

When I get more Copious Free Time, I may want to play.

When I put together the wiring for my Icom 701 and my htx-100, I didn't use vox and did get voltage isolation using audio isolation 1:1 transformers. It was more than 2 cables (as I recall it was about 5-6 wires, since it is packed away while I am at an apartment that doesn't allow any antennas or radio transmitting). It also worked with mntty, cwtype and cwget, and a couple of other soundcard programs.

Just go ahead and build the transister and couple of resister interface, using your ptt connected to the serial port and you will have all the digital modes available. As I recall it was in the digipan docs. It took less than an afternoon to build and wire up connectors for both radios. thanks, John.

Hi gang,
Does anyone remember a kit sold back in the late 60's called a
"Norelco Electronics Lab"? It was something like the Radio Shack 100 in
1 kit. You could build all sorts of coll stuff on a masonite (?) board
using spring clips.

Mine is long gone, but I'm wondering if anyone has seen one come up
for sale via the usual suspects (ebay etc).

I steadfastly refused to go past 3.11 myself; I refused Win9x entirely.
Eventually my nephew shamed me into converting to linux, where I've been
happy ever since.

Epilogue: then the wife comes home needing Win98 for her real-estate
applications. *sigh*

The thing about FM'ing any part of a SS carrier component is that it reduces it's security features, all modulation should be done on the phase of the carrier to maintain it's 'hiddeness'.

Although security is not what your allowed on the ham bands I just thought I'd let you know anyways :)

I've had the complete UK magazine Wireless World article scanned in (the SS 435MHz SS digital voice article I mentioned earlier), trouble is it's been put into a .doc file by me brother - the darned things 64meg :(

Got to find a way of exporting the individual scanned in pages from the .doc file into separate image files so that I can jpeg em before sending to the people who wanted a copy.

I have a cable modem so no problem for me to send as is but others do not.

Clive

Actually, it sounds like he's trying to hawk a USB-connected disk array.

It looks more to me like something Babelfish would produce. I'd say the
spammer is using a dictionary to literally translate Chinese to English.

Win,

Your sense of humor is priceless!

FWIW, Matjaz Vidmar describes a technique he published in 1985 that
sounds very similar to Rohde's feedback scheme:

"The phase noise can be reduced by a carefully designed bias
regulator, to stabilise the current through the bipolar
transistor, so that the impedances and phase shifts do not
change."

http://www.vhfcomm.co.uk/s53mvvco.htm

If my guess is true, Rohde's patent may be invalid due to prior art.

The ironic thing is that even the beta releases of Win95 were so much
better than Win 3.1x it's not even funny. Most professional DOS/Windows
developers (like myself) installed the spring '95 beta release of
Chicago and never looked back. You and Mike, on the other hand, appear
to have barricaded yourself in a roomful of snakes just to avoid dealing
with the roomful of worms next door. :)

It's perfectly reasonable to go with Linux over Win9x if that's your
thing, but using Windows 3.1 in 2002 just to be contrary is, to say the
least, self-defeating.

QST reviewed the radio some years back (I don't know the issue), and
they did deal with the generator. I don't recall the details, but
it was definitely low current. I think they tried to run a one or
two transistor transmitter from the generator, and discovered that
it was not a very stable supply.

On the other hand, it is a superhet as far as I know. Nothing
special, the unique part of the radio is the generator, and the
high price is so to fund the main project, getting the radios
into the hands of those who really need them. One key point
I remember from the review was that the audio output was very low,
which is where they saved a lot in current drain.

Source record: 46762

Just read a July '99 qst article detailing LDG's digital wattmeter. I would like to try to do the same by 'kitbashing' a couple of old heathkit swr/wattmeters (the venerable HM-102 and HM-2102) and an 8052-based SBC I have. Got a couple of quick prelim questions. Would like to know if the 2102 marketed as a vhf meter would work with satisfactory sensitivity/accuracy at 440 Mhz? Gonna whip out the voltmeter tomorrow and test it myself but anyone have any idea what the ballpark is on voltage out of the pickup coil w/ 100 watts HF on the hm-102?? Thanks very much in advance (anybody want to collaborate with me on this ??)

Gary

921. Moving 2.45GHz 1 meter - Pls help

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-01-31 11:26:25 UTC
From: Gollywog <_eng@ilos.net>
Message-ID: <BR968.668$8i2.21571@news2.mts.net>
Source record: 46763

Anybody/Everybody:

I'm working on ideas for an antenna array for a remote control project. I need to move a 2.45GHz unmodulated carrier from a receiving antenna and pre-amp board 1 foot to a switching/amp board then 3 feet to a second switching/amp board then 1 1/2 feet to a central amp/mixer board. The array structure itself is made of 1 inch square hollow aluminum tubing.

Do I use coax of some sort and run the lines inside the aluminum tubing? My signal is single ended after the first board but I could convert to differential if twisted pair is going to give me better noise rejection and/or substantially less signal attenuation. Is there any way to use wave guides inside the 1" tubing? I need a fairly cheap solution (since there are 40 antennas in the array) and it has to withstand fairly substantial vibration and mechanical stresses.

Suggestions appreciated,

Mike Whitfield (VA4MGW)

The array
> structure itself is made of 1 inch square hollow aluminum tubing.
>
> Do I use coax of some sort and run the lines inside the aluminum
tubing?

- From the brief description you've given, that sounds like it's
probably a reasonable approach ... just use a coax type that's
low loss at 2.4 GHz and use connectors suitable for the frequency.
(RG-58 and PL-259's won't cut it ...)

> My
> signal is single ended after the first board but I could convert to
> differential if twisted pair is going to give me better noise
rejection
> and/or substantially less signal attenuation.

Stay with coax ...

> Is there any way to use wave guides inside the 1" tubing?

1" tubing would be well below waveguide cutoff frequency at
2.4 GHz, so that wouldn't be possible ...

>I need a fairly cheap solution (since there are
> 40 antennas in the array) and it has to withstand fairly substantial
> vibration and mechanical stresses.

As I said, use low-loss coax and appropriate connectors.
You get what you pay for, but some surplus shopping may
yield good savings.

Chris,
Take my advice and bite the bullet. Go for a single (dual is better)
4-1000A in class B and you'll have an amp you'll be proud of for the rest of
your life. If you drive it conservatively the tube can last you 40 years or
more. Besides, they're relatively cheap on the open market, and good pulls are
always available for a reasonable price.
If you use a plate supply of say 3900Vat 5.0 or so KVA that will be ample to
drive the tube to legal limit and then some with 60 watts or so.
I have one I built up and run 6KV on the plate and have driven it with 200
watts. It really sings and commands a good signal on the band.
Just my two cents worth.....

Just a guess, but I'll bet a radio made to work on such a teensy little
generator would be really frugal on batteries.

On the one that I had the microphone was commoned with the case.
I separated the case and the microphone lines at the switch in the base,
leaving the case of the mic connected to the "ground" of the radio, then
hooked the mike to the radio mic+ and mic-.
Insulate the mic element from the case in the head.
KA9CAR

Depends on how much of an impedance "bump" you can
tolerate ... vs. the cost of the connectors.

50 Ohm connectors like SMA, SMB, etc. with low loss coax
and good microstrip construction on the PCBs will give the
best performance, lowest loss, and best SWR. Skipping
the connectors and soldering directly to the PCB is a cost-
saving shortcut that may or may not be acceptable.

For example, are you concerned with phasing or phase
matching?

I don't know enough about your application to know how
much mismatch you can tolerate, but at 2.4 GHz, it doesn't
take a lot of "tails" in the center conductor and shield braid
connections to create mismatch. (It's not like HF, where you
can have an inch of center conductor and an inch of shield
braid to the center pin and ground lug on an SO-239 and
not even notice it ...)

Actually Rhode has done several articles in QST.
For cleaning up the DDS he ran the DDS output at 10.7 MHz and ran it through

readily available crystal filters, (Digi-Key has them).

For the Oscillator he showed that it was better to get rid of the
traditional
gate to ground diode. This improves phase noise performance.

His low noise oscillator for 74 - 105 MHz uses a 2 tap inductor.
The 1st tap goes to the fet gate, the 2nd tap went to the fet source, the
bottom of the inductor went to ground.

He also paralleled multiple vari-cap diodes together to reduce the
noise from these diodes, the idea being if noise is positive going on
one diode, another diode could be negative going and the two help to
cancel each other.

QST May, June 1994, Key Components of Modern Receiver Design

I've built his Low Noise Oscillator/PLL for 74 - 105 MHz. My main
work is programmming a micro-controller to control it.
Check out the Elecraft designs as well.

Hello, All,

When a youth (early 1970s) at my school library we had a text published by Audels.

It had transistorized circuits, and specifically a 3 transistor regenerative receiver.

Does anyone recall the title and author? (It is not the Radioman's Guide or is it?)

Any clues would be helpful.

I just hit ebay and got back 16 matches but none seem recent enough to
have transistorized circuits.
You might want to keep trying that or try one of the big online
booksellers...many have a 'used/out-of-print' section.

Thanks... I did the same on Ebay.

The problem with the big used online booksellers is they will return 200
items in a search, and I am still not sure of the title.

Unless someone clues me in, I will continue to look at Ebay as the prices are
reasonable, <$10 so if I buy a book and I'm wrong, it isn't a big deal.

Thanks again.

Clyde

935. Has anyone homebrewed an antenna for an HT with an SMA connector?

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-01 01:43:31 UTC
From: jason_hsu@my-deja.com
Message-ID: <f7d9a152.0201311743.25bb5e9@posting.google.com>
Source record: 46777
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew

I have a Yaesu FT-50R HT transceiver, and I use the ADI/Premier RD-98 antenna with it when walking around.

The pros of the RD-98 antenna:
1. It is small enough to easily and quickly attach it to my radio.
2. It is dual-band (2m and 70 cm).
3. It has MUCH better performance than the rubber duck.
4. It is flexible enough to avoid breakage even when I bend it. This allows it to withstand MUCH rougher treatment than a rigid telescoping antenna can handle.

The cons of the RD-98 antenna:
1. It lacks a ground plane, and this causes the antenna to vastly underperform my J-Pole antenna and my mag-mount mobile antenna (assuming there is a ground plane). These other two antennas have their merits, but they aren't as convenient to use as the RD-98. (In case you are wondering, the J-pole has an SMA connector. I have a piece of coax with an SMA connector at one end for the radio and a PL-259 at the other end.)
2. I have to use a BNC-SMA adapter with it. This does add stress to the connector on the radio (but thankfully, nothing like the strain that a rigid telescoping antenna would cause). I know that there is now an SMA version of the antenna (which was not available when I first bought my RD-98), but a homebrew version would be cheaper AND be more conducive to the addition of radials.

Has anyone here homebrewed a 2m/70cm HT antenna with an SMA connector? I think QST had an article on this once, but the antenna used PL-259s or SO-239s.

The RF issues seem pretty easy. The vertical element can be a piece of metal wire that is 1/4 wavelength on 147 MHz, which would also be 3/4 wavelength on 441 MHz. This would be about 20 inches before making a slight adjustment for the velocity factor. I would then solder this to the inner part of the connector (I'm not sure what this is called, but it's analogous to the PL-259 at the end of a piece of coax). I would solder to the outer part of the connector one or more radials in order to provide a good ground plane. Then PRESTO! I have a REAL antenna that I can screw onto my Yaesu FT-50R.

The mechanical issues are much more challenging. What do I need at the feedpoint to hold the entire antenna together? What does it take to prevent moisture from leaking inside if I'm out in the rain? What does it take to keep the vertical element and the radials flexible enough (to avoid breaking the antenna or radio and make it more

compact for storage) and firm enough (so they retain their shape)?
16-guage solid wire, perhaps?

The RD-98 antenna seems to be made out of a flexible piece of wire
covered with a black plastic or rubber coating. There is plastic
cone-like object attached to the top of the BNC connector. I assume
it is there to mechanically shield the antenna feedpoint so it doesn't
fall apart.

Never had that kit, but I had something called "Electro" which had small
plastic blocks with electronic components in them, the leads on the
components were attached to magnets on the sides of the cubes, and the
cubes had schematic symbols painted on the top. To build a project, all
you needed to do was "draw" the scermatic using the plastic cubes (which
attached to a small steel plate, via magnets in the base).

I certainly wondered at the contradiction between "assembled" and
"homebrew". Obviously, the stuff must be manufactured on a very small
scale. If somebody wants something that's homemade, surely they'd
want to make it themselves. If they are unable to, I'm not sure
what the appeal would be for someone else to build it. In a lot of
cases, it's the building that is the appeal, more than the finished
product. (I realize, there may be some exceptions, such as when someone
describes some accessory that is not commercially available, but then,
someone who sold assembled units would only be filling a market.)

And I do remember seeing articles from hams who built their own
stuff, and happened to be blind. Not being blind, that strikes me
as being quite difficult, yet they were able to workaround the problems,
and enjoyed building stuff as much as the rest of us.

I was trying to find an answer to a question someone asked here (it's
on the tip of my tongue), and while trying to find it last night,
I just happened on the issue of QST that I was referring to.

It was the August 1996 issue, and it wasn't so much a review as
an article about the radio.

It says it's a 3volt generator. Apparently, the clockwork mechanism
is the important part, and it drives a "tiny 3vdc generator". I
wonder if that's actually a motor used in reverse, or they use something
special.

I see no mention of the current out of the generator (maybe they
never measured it), but they say they measured 15mW of audio in
the ARRL Labs when the radio was run off the generator, and a
whopping "almost 93mW audio while using an external 9vdc source".

Later down, it says "Tests showed the speed varied with load,
and voltage regulation was poor, making it generally not suitable
as a transmitter power source".

I thought I heard Art Bell hawking the radios, and there's a later
model or accessory that takes the generator output and powers an
"LED flashlight". That might be the place to start for the original
poster. I can imagine if you picked the wrong bulb, it would
load the generator so much that voltage would drop too low to
light the bulb. So they'd want to start with a very low current
bulb, with a low voltage rating.

Hi Jason,

I don't know if this is exactly what you are looking for, but I have homebrewed an antena for my TH-D7 that I regularly use for the outdoor events in my club and works reasonably well (much better than the supplied one):

(I hope my less than perfect english allows you to understand what I am explaining)

Just get a thin wire of flexible steel from a model toy shop; they use it in radio controlled planes and similar. Here they call it piano wire, because aparently it is similar to the wires used to make pianos. Well, cut it to about .27 wavelength (don't know why .27 instead of 1/4, but most references I found recomended it). Solder it to the inner pin of the SMA and put it in place. Fill the inside of

the SMA with two component epoxy or other heavy-duty glue. Put something at the other end of the wire to prevent it from harming you or others. You have it. You can bent it, allow rain to fall on it, ... Most important, if the wire is thin enought it acts as a "mechanincal fuse" for your SMA. It will bent before your SMA breaks.

Just another thing: Cut a 1/4 w. thin wire and put and 'eyelet?' on it, so that you can put it in the SMA before screwing the antenna on it. It will kind of work as a radial. It DOES make a difference with _any_ antena you are using!

Toni

941. Help: BURNDEPT Low band PMR set.

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-01 08:50:30 UTC
From: Keith Haywood <keith.haywood@icl.com>
Message-ID: <a3dksc$1itn$1@news.icl.se>
Source record: 46783
Cross-posted to: uk.radio.amateur,rec.radio.amateur.homebrew

Can anyone help with a circuit diagram or board layout for a
Burndept BE-525 low band transceiver - I'm trying to get one going on 4
metres.

It is a late model, three channel, crystal controlled job - probably ex Home
Office or similar, and was originally running on 80.2 MHz.

The only other markings on the case are
Type No:- M 2010 FVL.

Also, there appears to be a timer on the transmitter which limits
transmission time to around 1.5 / 2 minutes before the set switches back to
receive - anyone any ideas on how to override the timeout ?

Thanks.

Just curious...

How small can a QRP homebrew transceiver be built? (and I do not mean
fabricating a custom IC. I mean with typical homebrew methods.)
Perhaps something for 80, 40, or 30 meters.

Are there any designs on the web?

I was wondering if a single NE602 could somehow be used as a
transceiver, or would it be better to use single transistors?

Do a search on "QRP homebrew transceiver". Your search will return many possibilities...

W1FB's Design Notebook has a 1.5W 40m transceiver circuit using an NE602 as the prod detector in the receiver section, and uses a 741 as the AF amp. The remainder is 6 discrete transistors. All fits on a board under 3" wide and just over 4" long (70x114mm). It was certainly "typical" homebrew methodology as far back as 1980, and probably earlier. [NO SMDs. <G>]

I think it would be possible to make that design more sophisticated in the given space, or to keep it simple and shrink the board area, but better for you to try, than for me...

BTW, does anyone familiar with the circuit know the purpose of the dead-end track running between the pins of U2? (the 741). In the artwork in my copy of the book, it constitutes a short-circuit for the higher end of R10...just wondering...

Even the Pixie kit from HSC is pretty small, it will fit in an Altoids tin INCLUDING the battery. The SMK-1 that NorCal kitted last year was a little bigger, but way better. On a 5.5x6 cm board they crammed separate VXO's for transmit and receive, 2 602's, a regulator, a few transistors, and a whole pile of resistors, caps and inductors. Except for the crystals and one toroid, it was all SMT. Some folks have put surface mount rigs (excluding the battery) into the tiny Altoids tins (4X6 cm). At FDIM, somebody was demonstrating a VXO in a DIP package, I think it is available for sale at Milestone Technologies, but I'm not sure. A version of the TiCK keyer is available on a 20x23mm board and the components stick up less than 3mm. So yeah, you can get pretty small.

I'm thinking about trying to add two radials to my D7A. I'm using a
flexible 19" whip, so what I'm considering is just soldering a couple
pieces of piano wire to a washer that just fits over the SMA stud.

Experimentation with copper wire formed into an eyelet got noticeable
improvements with only one radial.

Since you've build the circuit, have you observed this to be actually true?
It doesn't sound right.

I think there was a rig built in the small tube that connector pins come in. It's certainly possible to build a transceiver with one transistor.

This could probably be definitively answered on the QRP-L list.

It's true about multiple diodes reducing noise, but I don't think Bill's explanation is correct. The idea is to use parallel combinations of low-capacitance diodes to reduce their equivalent resistance. That improves the tank-circuit Q, and anything that improves the Q will automatically improve noise performance.

The part about "negative and positive biases cancelling each other" is the reason why you put each individual pair of varactor diodes back-to-back. Since they can't both be forward-biased at once, they can't clip the RF voltage across the tank circuit, an effect Rohde previously showed to be bad for noise performance.

One of the smallest tranceivers I know of, is the KnightSMiTe project. I am almost done building one from the instructions on http://www.knightlites.org/new_page_6.htm. From the web page:

"KnightSMiTe project, it is a Surface Mount technology tranceiver kit. The board measures 1" X 1-3/4". The circuit is
a much revised Pixie II, that is, a DC receiver and about 100 - 250mW output. It uses a 3.6864 MHz crystal. Our version has a Variable Crystal Oscillator and offset, so the received signal can be heard even when it zero beats the KnightSMiTe signal. Power is supplied by a 9V battery. "

I think the biggest consideration is how small components you
can get, and your own skill at shoehorning it into a small space.

Roy Lewellan has described some very small rigs in QST, and no,
they weren't just the very simplest. From the photos, he's
put some effort into getting it all very small.

You could throw together something extremely simple, but other
than the novelty of "the smallest rig", and people have been
doing this over the years, would you really be happy with the
performance? Unless you just want novelty, you probably
want a little more circuitry, and then the question is
getting it into a small space, rather than starting with
a simple rig.

One thing people wrote about thirty years ago was that
useability goes down as size decreases. So you can squeeze
the circuitry into a small space, but you may have problems
manipulating the knobs, or finding panel space for the
knobs and controls you need.

I think some of the most practical tiny equipment that I've
seen has been focused on rigs people have built to
take into the wilderness. Wes Hayward described the Micromountaneer
in QST years ago, and he intended it for this purpose. It
was small enough for his backpacking needs, but it was also
a useable piece of equipment. It was a direct conversion receiver,
and VXO controlled transmitter.

Gollywog <_eng@ilos.net> wrote

<snip>
> I'm working on ideas for an antenna array for a remote control project. I
> need to move a 2.45GHz unmodulated carrier ...
<snip>

My main concern is stability in the phase shift introduced over the entire path from receive antenna to mixer. The processing approach I've worked out eventually "beats" the incoming sample stream (i.e. 5.5MHz alias wave) against a 9-point "reference wave" in a summation matrix and I use the resulting set of streams. The selection of these nine 32-bit floating point values allows "grand-total" phase shift to be canceled (over 360 degrees) at a precision far exceeding any practical level of stability. There are several gain, etc selections under DSP control and these changes include updating the reference wave from a table compiled during calibration. Other variations are going to be trouble.

I had worked out the whole receiving array strategy to use 75.55MHz (i.e. in the license free remote control band) but when I finally got around to reading the small print found "An antenna with a gain not exceeding that of a half wave dipole shall be used". Oops, I absolutely need directivity from the transmitter to minimize "multi-path" distortion resulting from reflections off nearby trees, buildings, etc. The current plan is to use a pair of dish or horn antennas on a rotating mast. One antenna emits 2.400GHz the other emits 2.47555 both locked to the same reference. I guess this is a single tone modulation (i.e. 75.55MHz) and an "upper side band with full carrier" mode emission. Or, if you like, a single tone modulated upper side band emission and a separate CW emission of the carrier frequency which will be needed at the receiver to recover the modulation. I plan to receive the 2.47555 at each of the 4 antennas of the current tetrahedron (i.e. pyramid shape), run it to the mixer board, and beat each against the 2.400GHz signal (from a 5th antenna on the top of the array) to get my four (phase related) 75.55MHz signals back. I then use one of these to reconstruct my 27.198MHz sample clock and I have my 9-point 5.5MHz alias wave from each for analysis by the DSP.

Suggestions appreciated,

Mike

There aren't any. Nor were there any the first time
you asked.

The project in question is old, and may be difficult
to reproduce. You may want to investigate something
a little more recent.

965. Dentron GL-1000 need help

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-02 01:36:49 UTC
From: ni4l <ni4l@charter.net>
Message-ID: <3C5B42B1.A1A3BCD3@charter.net>
Source record: 46707

Hi
I have picked up a orginial no mods Gl-1000 it has a plate voltage of
1100
volts on the plate. the swr between the rig and amp was checked 1:5:1
have a mn2000 between icom 751 and amp but since swr was ok just left in
thru mode.
when i flip swith to current it does not move.
when i flip to rel output and tune on it plus the adj in back for rel
output it shows around 4-500 on top scale but amp is producing no output
have drake w4 in line after amp shows 0 output. was checking on 3.919
since it is the only resonate wire antenna i have up.
any help on this would be greatly appreciated.
chris NI4L

The schematic does mention the inductance of those chokes,
though it's the parts list that specifies the Ohmite.

The two in the power line, the Z-50's, are listed as 7uH.
Since that's just building up a whole power line filter,
you might just try one of those power line filters that have
two terminals on one end, and a jack for a three-prong cord
at the other. It takes care of the chokes, and the worry about
getting capacitors for connecting across the power line.

Or, find a scrap switching supply, like from a computer,
and grab the line filter components out of that. There's
bound to be some sort of coil, though the ones I've seen
seen usually have some sort of bifilar wound coil, and some
capacitors that go across the AC line.

The other choke, the Z-28, is listed as having 21uH. Find one that is in the general range and enough current rating, and you should be fine. Try one of those moulded chokes, though I don't know about their current rating.

I can picture a chart listing those Ohmite chokes, and their inductance, but I can't remember where I saw it. There wasn't anything special about them, as far as I know, other than in an era where you'd tend to see 2.5mH values when you saw chokes, the Ohmite series was a range of inductors, that just happened to associate a given inductor to the ham band, in MHz, where it might be most appropriate.

You could probably just wind some coils of basically the same inductance, and get away with it.

Or try one of those 2.5mH chokes, after all, they worked in a lot of other items of that era, as plate chokes.

Again, there's nothing magical about those coils.

The 3003, according to a chart I found, is a .5 inch diameter coil, 2
inches long, with 16 turns per inch.

The 3016 is a 1 inch diameter coil, 3 inches long, with 32 turns
per inch.

Oops, I see the parts list even specifies that information.

So for the 3003, find some sort of coil form half an inch in diameter
and 1.5 to 2 inches long. Get some wire. Since the parts list
says 23 turns, then fit that into a length bit longer than 1 inch.

For the 3016, find something an inch in diameter, maybe 1 inch long.
The parts list specifies 19 turns. So wind it so it fits into
the about the right length.

From "Designing Low-Phase-Noise Oscillators", Rhode, QEX 1994

We can improve the noise performance of a VCO by using multiple tuning
diodes in the antiparallel arrangement of Fig 15. The improvement arises
from two causes. First, the individual parallel diodes each have a smaller
capacitance value than a single diode would need. This helps because
small-cpapacitance diodes have less noise (lower equivalent noise resistances)
than larger-capacitance diodes, due to the fabrication technology. Second,
because the noise voltages from the individual dioes are uncorrelated, they do
not directly sum together. Thus the effective noise is less than that of a single
diode. While this scheme increases the cost of the circuit, it can reduce the
diode noise contribution by as much as 15 or 20 dB compared to using a single
diode.

(sorry, I can't include Fig 15. but it shows 2 sets of 6 pairs of BB809 diodes)

Regarding Q, from the same paper.

When we extend our design to become a VCO, by adding a tuning diode, we must also
consider the phase noise introduced by that diode. Contrary to what you may have
read elsewhere, this noise is not due solely to Q reduciton from the added diode.
The diode itself introduces noise that modulates the VCO frequency.
The easiest way to analyze this noise is to treat the diode's noise contributions
as that of an equivalent resistance R. This resistor can then be considered to be
generating the thermal noise voltage that any resistance exhibits:
Vn = sqrt (4 KToR deltaf)

Rhode not me.

The equivalent resistance is solely to model the noise not the loading effect
on Q. (Not to say that the diode doesn't alter Q, just that the purpose of the
equivalent resistance is to model the noise.)

Bill Kirkland
VE3JHU.

I suggest you read the QEX paper Designing Low-Phase-Noise Oscillators,
October 1994.

From a later paper
A High-Performance Hybrid Frequency Synthesizer, QST March 1995

A key factor in the synthesizer's relative simplicity is that it uses a single,
wide range LO VCO rather than several switched VCOs. Achieving low phase noise
with this arrangement requires taht the loop's tuning diodes, and therefore the
associated loop-filter op amp, operate at a considerably higher voltage than
the system's 5 and 10-V buses.

He uses +28 Vcc and generates a small negative voltage for Vee off of the PLL
chip for the OP AMP power rails

Solid State Design For the Radio Amateur pre-dates 1982.
I got my first copy before I started University in 82. My 2nd copy
is much more recent and I don't think anything has changed.

The circuit I believe you are referring to could be done with the "ugly"
method. It is simple enough. Good luck getting an MC1496G, this is the
standard MC1496 mixer/modulator in a metal can. You will more likely find
a 14-pin dip part. Even Philips made the MC1496 at one time. Try Mouser, they listed 2
substitutes. (Listed in
"Dan's Small Parts for $1.25.
http://www.fix.net/dans.html/

40673's used in the IF Amp are long out of production.

Wes Hayward has a good SSB/CW transceiver in QRP Classics, pg 153.
I've built several versions of the circuits in his design and they work fine.

If you bump the LO drive to say 7 dBm you could use a Level-7 Minicircuit
mixer. They have several in the sub-$5 class which they advertise in RF Mags.

The crystal filter is available from "International Radio"
Toroids are available from Amidon (check the ARRL handbook)

i took the relay out and cleaned it really good also checked to make
sure that no shorts giong to pl259s. i checked for any loose connections
found none. Its like when you key it up and apply power you can just
barley see the output meter after the amp barely move. with the amp off
talking thru it have no problem getting out. Can press relay when i am
receiving and receive goes away. Its not letting the power come out of
the amp.Is there any thing else i could check?
thanks for your time

974. Ten-Tec Scout 555 band-switching project

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-02 08:24:27 UTC
From: googlyelmo@earthlink.net
Message-ID: <3C5BA230.9E555346@earthlink.net>
Source record: 46716

I have been thinking about constructing a band-switching box for the modules
my Scout uses, really since a month or two after I bought it in 1998. I love
this little rig, but I am getting mighty tired of swapping the band
modules in and out, in and out. I am surprised no one has published a project
for a switch box for this rig in the almost eight years the Scout has been
in production. What I have planned so far is an
ABS/plastic or aluminum case, large enough to accomodate 6 modules (I
don't use my Scout on 160, 17, or 12), complete with a switch and
indicator lights.

I keep meaning to call Ten-Tec's technical support
department to find out about connectors and ask their advice,
but I never seem to make it before they go home @ 4 p.m.
Eastern. I need to know what the type of connectors used in the modules

are called (esp. the edge-card, but the barrel/coax ones as well), and the
size, ratings, and where I can get them.

The modules will connect to the box, with one flat-ribbon cable going
from the box to the module socket on the Scout. Theew will be a switch to
select the band, and a lighted indicator for the band as well. I need to figure out
how to do this so that the job is reliable, durable, and looks nice.

Other questions and issues I have with this project are: what type of selector
switch (e.g. rotary ceramic, electronic, multiple push buttons, etc.) to

use, and the best wiring arrangement for six modules?; the best case material?;
any issues with grounding, cable lengths, heat, etc.?

So, that's my project plan. Not terribly complicated, but I do have a
few things to work out. If you have any suggestions addressing the
questions I have raised above, I would be grateful to hear them. Any
other comments or observations are quite welcome too. And BTW, has
anyone else built a box like this for this rig before, or come up with
another good band-switching scheme for the Scout and its modules? Once I

get the project finally thought out I will begin building, and post pictures and an account of my progress on the web. Thanks.

Will, KD7BFX

OM: Why not try building it with the now popular Manhattan method (copper clad board with islolation pads). I am building an SSB exciter for 17 meters using this method. My rig has the filter at 5.173 Mhz (I had the crystals for a filter at that freq.)

Please tell us more about your project.

such was more interesting 30 years ago, some kits were sold by VHF
communications, but I doubt you will find it today. DJ8ES showed
around 1990 some inexpensive solutions, but I don't think a kit was
ever sold commercially

From: Harry Williams <harry.w.williams@syntegra.com>
Message-ID: <3C5BED36.BD9F608B@syntegra.com>
Source record: 46720

I am constructing a matching network for a vertical and will need to use some relays to control the matching configuration. I have 2 relays that have a 24VAC coil. It appears that the relays pull just fine using 12VDC. Can I use CD to energize a relay whose coil specifies AC? In general is there a preference, DC or AC, in this type of application? I guess I am thinking of induced noise during receive if I use AC but maybe that is not an issue since most of the old dowkey coaxial relays used 110VAC coil. Any thoughts on this would be appreciated.

Thanks,
Harry - W0PIY

Source record: 46721

A couple of turns may be effectively shorting the antenna feedline at 7 MHz. This would give a very flat dip which may be difficult to pick up. You could try transforming the impedance via a toroid with quite a few turns on the secondary (to antenna) and only a few turns on the primary feeding a link also with with a few turns which is coupled to the GDO. They generally dont have a flat reading across the band because they may tune an octave or more for each band. However a resonance is generally quite sharp.

Mike, you could at least graduate to Windows-for-Workgroups,
that was the final improved Windows 3 version! Actually, my
suggestion is to get serious and jump straight to Windows 2000
with a set of new computer hardware. $650 will get you a new
box with an everything-on-the-board mobo with a say 1.5GHz AMD
Athlon and 512M of DDR memory: one screaming Spice machine.
Add $150 for a hard drive plus $150 more in tax to Microsoft...

OK, maybe Linux doesn't sound so bad, keep that last $150 and
save some more money by just getting 256M of DDR ram.

For your application the AC relays will work just fine with DC applied. The voltage required to pull them in needs to be checked. 12 VDC might be too much and burn the coils out if on for long periods of time. Try series resistor equal to the coil DC resistance.

You're welcome. I purchased the QEX CD collection, I highly recommend it.
As for the PCB I built it a year or so ago. My problem is that I have too many things on the go. Moving from an apartment to house caused quite an interruption.
The tricky part I found is writing the micro-controller code. Coming up with 32-bit numbers to program the DDS with and cover the tuning range from 70 to 100 is slowing me down. If the micro does all the calculations it involves doing divisions. As I am writing in assembler this gets to be "fun".
I actually got the code working but then I moved. I have to get back to it and interface a shaft encoder. Here I am thinking of using a mouse. I took one apart
and it looks like a crude shaft encoder. For tuning purposes we don't need great angular resolution, just lots of increments over 360 deg.

Anyone taken a PS-2 mouse apart and understand the interface to the PC?

I still have to work on the rest of the radio as well :).

Amateur Radio Newsline™ Report 1277 – February 1, 2002

Amateur Radio Newsline report number 1277 with a release date of Friday, February 1st, 2002 to follow in 5-4-3-2-1.

The following is a Q-S-T.

The President of the United States speaks to hams in Florida and is ham radio seeing a second Solar Max? These stoies are first on amateur Radio Newsline report number 1277 coming your way right now.

(Billboard Cart Here)

**

BREAKING NEWS: PRESIDENT BUSH COMES TO HAM RADIO

The President of the United States has come to ham radio. Bill Burnett, KT4SB, has the details:

--

President George W. Bush has taken to the ham radio airwaves. This, to thank the Florida Amateur Radio community for being ready to serve the public when it is needed.

The President’s comments were made during a stopover the morning of January 31st at the Volusia County Fire Services and Training Center near Daytona. Around 9:15 AM Eastern Time, President Bush checked in to the Northern Florida Amateur Radio Emergency Service Net on 3.950 MHz using a portable station set up John Schmidt, AF4PU. Then the President made these remarks to the 40 or so stations listening to the net:

--

President George W. Bush:

"I want to thank all the volunteers who help make sure that Florida is prepared for any kind of emergency. I also want to assure you that your Federal government is doing everything we can to make sure that there is not an emergency--starting with unleashing the mighty U.S. military overseas to bring evil ones to justice. But should there be a need for a response, I want to thank you all for helping our communities be prepared. And finally, I want to tell you--we are lucky to be Americans and may God continue to bless this great land of ours. Thank you very much."

--

Needless to say the net members were delighted to have the President of the United States address them. More important, hams nationwide can now be sure that President Bush knows that Amateur Radio operators are ready to serve whenever he, and the nation, needs to call on them for help.

In Miami, I'm Bill Burnett, KT4SB, reporting for the Amateur Radio Newsline.

--

The complete story is on the web at

HAM RADIO SCIENCE: TWO SOLAR MAXIMUMS THIS SEASON

In case you are wondering why the current solar cycle is still providing such amazing VHF and UHF DX, one researcher may have the answer. He says that the current cycle appears to be having a second peak and that this is really not very unusual. Henry Feinberg, K2SSQ, looks at the scientist and his latest data.

--

The most recent and ongoing Solar Maximum -- or Solar Max -- theoretically crested in mid-2000. Sunspot counts were higher than they had been in 10 years, and solar activity was intense. One remarkable eruption on July 14, 2000 caused brilliant auroras as far south as Texas. But after that, sunspot counts slowly declined and the Sun was relatively quiet for month-long stretches. Most scientists said that the Solar Max was over. But was it?

Now, as 2002 unfolds, the National Aeronautics and Space Administrations solar foorecasters say that it looks as if the Solar Max is back with us again. The Sun is again peppered with spots, eruptions are frequent and hams notice that the VHF DX keeps rolling in.

Why is this happening? Well David Hathaway, a solar physicist at the NASA Marshall Space Flight Center in Huntsville Alabama has one theory. Hathaway says that the current solar cycle appears to be double-peaked, and the second peak has arrived.

--
Hathaway Audio Here
In-Q: We have seen other cycles...
Out-Q: ...define this maximum
--

Scientists track solar cycles by counting sunspots and Hathaway is an expert forecaster of sunspot numbers. He says that sunspot counts peaked in 2000 some months earlier than we expected. He says that the subsequent dip toward solar minimum seemed premature and before long, sunspot counts reversed course and began to climb toward a second maximum that now appears to be only a few percent smaller than the first.

--
Hathaway Audio Here
In-Q: Its a bigger than average...
Out-Q: ...smaler than 19, 21 and 22.
--

Hathaway notes that there is a widespread misconception that solar activity varies every eleven years like a pure sinusoidal wave. It isn't. He says that solar activity is chaotic and there can be more than one peak in any given period. Translated for ham radio: Enjoy the VHF DX while you can.

For the Amateur Radio Newsline, Henry Feinberg, K2SSQ.

--

Hathaway says that the Solar Max eleven years ago was much the same as this one. The first peak arrived in mid-1989 followed by a smaller maximum in early 1991. And if you are interested in hearing more about this interesting phenomena from David Hathaway its as easy as taking your web browser over to www.rainreport.com. Or you can call on the phone to area code 847-827-7246. (NASA, RAIN)

**

HAM RADIO IN SPACE: HF ANTENNA INSTALLED ON ISS

High Frequency ham radio operations from the International Space Station could be on the not to distant horizon. This, after a successful space walk on January 25th to install another antenna on the orbiting outpost. Amateur Radio Newsline's Roy Neal, K-6-D-U-E, has the details.

--

The spacewalkers have had another good day in space. On Friday the 25th of January, Cosmonaut Yuri Onufrienko, RK3DUO and Astronaut Dan Bursch, KD5PNU, successfully mounted a second ham radio antenna near a docking port amidships on the International Space Station. It is made of flexible tape and is similar to but longer than another antenna installed on January 14th. That one tunes both VHF and UHF frequencies. The new antenna will tune HF frequencies.

ARISS Board Chairman Fran Bauer, KA3HDO, says it definitely will work on ten meters and may even be made to work on 15 and 20 meters. BUT right now there is no gear on board to handle those frequencies. Experiments using the lower frequencies are on the list of futures for ARISS but no timetable has been assigned to design and build them.

Owen Garriott, W5LFL, the first man to operate ham equipment in space, once prophesied that a five watt transmitter in orbit might well be heard simultaneously world wide. The great number of hams with good stations on the lower frequencies also makes them enticing to ARISS. It's a safe bet that serious consideration now is being given to expedite such a project. Once a station is sent up, the antenna will be waiting.

The new antenna is the second of four to be installed on board the space station. No timetable has been announced for the final installation. All of

these amateur antennas were built by Italy, tested and qualified in the US, to fit ports built by Russia, as befits the international nature of the ISS.

For the Amateur Radio Newsline, Roy Neal, K6DUE

--

Installation of the 2.5-meter long flexible tape antenna involved not only the mechanical deployment but routing cables and establishing the R-F connection as well. (ARISS)

**

HAM RADIO IN SPACE: THAT ANNOYING SATELLITE IS OFF 2 METERS

An annoying mystery satellite transmitting AFSK, frequency modulated Morse on 144.100 MHz for several days has been identified. It turned out to be a signal from the MAROC-TUBSAT satellite. This is an Earth-sensing spacecraft owned by a Moroccan government agency called he Royal Center for Remote Sensing. It was placed into a polar orbit by a Russian launcher on December 10, 2001.

As soon as he learned of the interference to amateur operations, Professor Udo Renner of the Center had the 144.100 MHz transmitter turned off. He then notified AMSAT Germany that TUBSAT was no longer on two meters.

But TUBSAT also has a downlink at 436.075 MHz. This system is only busy over North Africa and Europe and only when the control stations in Rabat and Berlin are activated. It has not been heard elsewhere in the world. (AMSAT-NA)

**

SPECTRUM PRESERVATION: ARRL SAYS IT WILL FIGHT TO KEEP RFID OFF 70 CM

The ARRL says that it will go all the way to protect the 70 centimeter ham band from a threat brought by commercial interests. At issue is a plan from SAVI Technology and already tentatively agreed to by the FCC to deploy unlicensed transient R-F identification tag transmitters operating between 425 and 435 MHz. These tags run at much higher field strengths and duty cycles than Part 15 rules now permit.

According to a League bulletin issued on January 29th, ARRL officials have already met with members of the FCC staff as part of the League's effort to stave off a band threat. The bulletin says that General Counsel Chris Imlay, W3KD, and ARRL Technical Relations Manager Paul Rinaldo, W4RI, delivered an ex parte presentation to FCC Office of Engineering and Technology staffers January

14th outlining the opposition of the ham radio community. (ARRL)

**

FCC: CHAIRMAN POWELL HOME AFTER HOSPITAL TESTS

Federal Communications Commission Chairman Michael Powell was discharged from the hospital on Friday January 25th. This, after a two-night stay in the to undergo tests because of a lingering stomach bug.

Stomach discomfort caused him to cancel appearances at the Consumer Electronics Show in Las Vegas on January 8th and again at the annual conference of the National Association of Television Program Executives on Wednesday January 23rd. Doctors advised precautionary tests that required overnight stays at Walter Reed Army Medical Center in suburban Washington. (Published news reports)

**

ENFORCEMENT: THAT SONG WAS NOT AS BAD AS WE THOUGHT

The Federal Communications Commission has dropped an indecency fine against a Colorado radio station. KKMG FM of Colorado Springs had been fined seven-thousand dollars for airing the edited version of Eminem's "The Real Slim Shady." This, after a listener wrote the regulatory agency to complain.

At the time the fine was issued federal regulators said the edited version still included some expletives and references to violence and graphic sex. But the FCC now says it has reconsidered. It now says that the lyrics in the edited version didn't violate its rules by being "patently offensive." (FCC)

**

RESCUE RADIO: BRAZIL RADIO OPERATORS HELP IN POWER OUTAGE CRISIS

A major electricity blackout hit at least five Brazilian states on January 21st, and it was hobby radio enthusiasts that let people know about it.

The blackout, which began at 1:30 p.m., hit hardest in the industrial southeast and the major cities of Sao Paulo, Belo Horizonte, Rio De Janeiro, Goiania, Vitoria and the capital, Brasilia.

According to news reports, Brazil’s National Energy Agency blamed the outage on transmission line failures. The same news report credited Brazilian hobby radio operators as informing authorities that subways in Rio De Janero and Sao Paulo were halted and that traffic lights were out snarling commuters in several areas.

The outage was caused by a failure at the Itaipu hydroelectric station in southwestern Brazil. A power-line failure caused thirteen of the dam's eighteen turbines to stop, cutting off nearly 20 percent of the country's energy. Power was restored about three hours later. The news story did not identify the radio operators as being hams. (Various shortwave news reports)

**

RESCUE RADIO: NEW INTER-JURISDICTION RADIO SYSTEMS BEING INTRODUCED

Santa Clara County California, police, fire and emergency medical personnel have never been able to communicate with one another at the scene of a major disaster. This is because each agency uses a separate radio system. That is expected to change this year.

Santa Clara County will be leading the nation in using new digital radio technology to solve the inter-agency communications problem. The new system will allow up to eighteen participating jurisdictions in any county to talk to one another instantly.

By way of example, once the system is up and running, officers involved in one of California's famed high-speed car chase will be able to talk directly to police in the neighboring jurisdiction as the suspect approaches that town. They won't have to switch channels or go through dispatch centers. This means less time wasted and the probability that lives will be saved.

While Santa Clara county is at the head of the pack in adopting this new digital communications technology, the same news reports say that and Washington, D-C is not far behind. (Cal-State Info.)

**

PUBLIC RELATIONS: A CHEAP SATELLITE

A Cheap Satellite is the name of an Associated Press item that highlighted the work of the faculty and students at the United States Naval Academy in the development and launch of the P C Sat ham radio satellite. The story tells how the twenty-five pound bird was built using off the shelf products including a tape measure for its antenna and rechargeable double A cell batteries for power.

The story was written by Tom Stuckey and moved on the wire on Wednesday January 23rd. It noted that PCSat, was the 44th amateur satellite put in orbit. It is one of more than a dozen built by university students around the world. (VHF Reflector)

**

CONVENTIONS & HAMFESTS: ORLANDO HAMCATION WEAK SIGNAL FORUM

The Orlando HamCation will host its first ever Weak Signal VHF and UHF forum. Beginning at 2 p.m. on Saturday Ferbruary 9th, the one hour session will be moderated by N2CEI, of Down East Microwave. Also, Tom Haddon, K5VH, will be on hand to motivate more Florida hams to become active on the Microwave bands.

If you are in the Orlando Florida area on February 8th to the 10th drop in on the Orlando Hamcation. For more details and or advance reservations, go to oarc.org/hamcat.html on the World Wide Web (W2BZY)

**

CONVENTIONS & HAMFESTS: DATE CHANGE FOR RADIOFEST 2002

Brian Broggie, W6FVI, asks that we pass along a date change for RadioFest 2002 sponsored by the Naval Post Graduate School Amateur Radio Club in Monterey California. The new date is February 23rd. More information is in cyberspace at k6ly.org/radiofest. (W6FVI)

BREAK 2

Here when you need us 52 weeks a year. We are the Amateur Radio Newsline, with links to the world from our only official website at www .arnewsline.org.

(5 sec pause here)

**

HAM RADIO SCHOLARSHIPS: THE DARA SCHOLARSHIPS

The Dayton Amateur Radio Association is one of three ham radio organizations seeking nominations for its scholarship program for the 2002-2003 academic year. According to DARA, applicants must be graduating high school seniors in 2002 and hold any class of an FCC issued mateur Radio license. The scholarship awards run up to $2000, as determined by the scholarship committee. Money must be used toward tuition at an institution of higher education.

To obtain an application, send a self-addressed, stamped envelope to the Dayton Amateur Radio Association Scholarship Program, 9873 Lower Valley Pike, Medway, Ohio 45341. You can also obtain an application by e-mail to n8emo1@msn.com. Completed applications must be postmarked no latter than June 1st to be eligible for this years scholarship program. (DARA)

**

HAM RADIO SCHOLARSHIPS: THE FOUNDATION FOR AMATEUR RADIO

Another organization offering scholarships to hams id the Foundation For Amateur Radio. The Washington, D.C. area group will administer sixty-two scholarships for the academic year running from 2002 through 2003. Licensed Radio Amateurs may compete for these awards if they plan to pursue a full-time course of studies beyond high school and are enrolled in or have been accepted for enrollment at an accredited university, college or technical school. The awards range from $500 to $2500 with preference given in some cases to residents of specified geographical areas or the pursuit of certain study programs. Additional information and an application form may be requested by letter or QSL card to the FAR Scholarships, Post Office Box 831, Riverdale, Maryland, 20738. (Foundation For Amateur Radio)

**

INTERNATIONAL - SOUTH AFRICA: SA RADIO AMATEURS OF THE YEAR NAMED

Turning to international news, South Africa is honoring two of its own as that nations Radio Amateurs of the Year. Q-News Graham Kemp, VK4BB, brings us the details:

--
The South African Amateur Radio Development Trust have announced the winners of the 2001 Siemens Radio Amateur of the Year Award. This award is made annually to a Radio Amateur who has made a major contribution to the Amateur Service either on a technical or development basis in ZS land.

The award has been bestowed jointly on Bradley Phillips, ZS5BP, and Garth Wilson, ZR6CY. ZS5BP for his work on the introduction of Iphone and the development of the Internet Radio Linked project. ZR6CY for his continuous efforts to develop communication skills amongst the youth. He has to date presented no less than 80 camps for Voortrekkers to learn the Morse code and basic communication skills.

For Q-News Australia, I'm Graham Kemp, VK4BB, reporting for the Amateur Radio Newsline.

--

This award is considered as South Africa's equivalent to the Dayton awards presented here in the United States. (SARL News, Q-News)

**
INTERNATIONAL - UK: KENWOOD TROPHY AWARDED TO G3XWH

Meantime, over in the U-K, Richard Horton, G3XWH, who chaired the RSGB's Future Licensing and Examination Forum has been awarded the Kenwood Trophy. This, for his significant contribution to training and development in amateur radio.

Horton recently retired from the Radio Society of Great Britain's Board where he was responsible for amateur radio development. His committee was responsible for much of the work that went into the creation of the new U-K Foundation Class license. (GB2RS)

**
DX

In DX, DJ4KW and DK9GG are currently active from Belize as V31YN and V31GW, respectively, through early February. Activity is on CW, RTTY and PSK 31. (RSGB)

And IN3QBR will be active from Vientiane as XW3QBR until the 31st of July. He will be joined, from the 20th of April until the 10th of May by IN3ZNR operating as XW3ZNR. (OPDX)

And R1ANF began operations as CE9 slash R1ANF on the 29th of December from a Chilean base in the South Shetland Islands. He is active on 10 to 28MHz with 100 watts to an R6000 vertical. For all three QSL as directed on the air. (RSGB)

**
THAT FINAL ITEM: CELEBRATING THE LIFE OF ED CLEGG W2LOY

And finally this week, if you were on the VHF bands in the 50's, 60's and 70's then the name Clegg Labs touched your ham radio operations. And as we hear in

this report, the family of the man behind the gear is inviting you to help celebrate his life.

--

Even if you did not own any Clegg gear, the chances are that you talked to someone on the air who did. Whether it was the top of the line Interceptor receiver and Zeus transmitter or the entry level 99'er transceiver, it was easy to spot a Clegg signal by its almost overpowering modulation that seemed just right for the R-F carrier it was on.

Almost every product that carried the Clegg label was designed by the company's founder Edward T. Clegg, W2LOY. When he moved the company to Pennsylvania in the 1970's, Ed took the call W3LOY. Likewise, after retiring to Ohio he traded the 3 for an 8, but kept the famed L-O-Y suffix.

And regardless of the call area, Ed Clegg was first and foremost a communications designer well ahead of his time. Even more important, he was a positive influence on just about everyone with whom he came in contact.

Ed Clegg left us last September at age 80. Now, his wife Martie will be hosting a gathering in March near the Clegg home in Lancaster Ohio. The purpose is to celebrate the life of Edward T. Clegg. And they are asking you to help.

Martie, her daughter Linda and Linda's husband Rob MacGuffie, K2HZN, are asking anyone who knew Ed to share in the celebration. They know that most of you won't be able to be in Lancaster Ohio on March 30th. But some of you do have memories, stories, photos and other Ed Clegg memorabilia that would help to make this day even more unforgettable.

If you have something to share, please contact Linda and Rob before the end of February. Their address is 70 Province Road, Gilmanton New Hampshire with a zipcode of 03237. Rob's cyperspace address is K2HZN@yahooo.com.

For the Amateur Radio Newsline, I’m Cathy Anno, KB0FDU.

--

By the way, a number of us here at the Amateur Radio Newsline began our ham radio careers using gear designed by Ed Clegg. In fact, our producer Bill Pasternak, WA6ITF, got to know Ed while Bill was still a teenager operating A-M on the 6 meter band. (Clegg family)

Thanks, Win.

Actually, the main reason for staying with Win 3.x is I have my own
file management system that runs in DOS. It keeps a list of the files
in each directory along with a comment that I can edit to include key
words that describe the contents. The comment is attached to the file
and stays with it when I copy or move the file to different
directories.

Another program collects all the directory lists and makes a single index. Unlike most indexing programs that run overnight, this takes a little over one minute.

Using the index, I can search the entire contents of my 8 gig hard disk in less than two seconds, and find all the files that meet the search criteria.

With a single keypress, I can go to the directory that contains the file, and the cursor is automatically placed on the target file.

Then comes the magic. I have five or six keys assigned to do different things depending on the file extension. I can edit the file, view it in various DOS graphics viewers, edit images using Windows programs, view PDF files using Acrobat that runs under Windows, view HTML files using Opera, Netscape, or MSIE under Windows, etc.

This technique reverses the normal opertation of GUI programs where you first pick the program you wish to use, then try to find the file. It may be in any of thousands of directories on the disk, and may be among tens of thousands of files. I cringe when I watch someone try to find a file in Windows or Linux. The waste of time is horrible.

The key is to be able to load Windows or DOS programs as needed. A DOS program can call W95/98 programs, but it is painful. It is very easy with Win 3.x

I actually have three Windows installations. I use WFWG on drive C, and two separate Windows 3.11 installations on drives F and G.

The one on drive F is strictly for internet use, since Opera, Netscape, and MSIE regularly crash, and sometimes crosslink all the files on drive F. I have a backup computer that duplicates all the files so restoring is easy (but slow).

WFWG on drive C is for fast loading of a few Windows programs like Opera and Acrobat from my DOS file manager. The one on drive G is the largest and slowest installation, and is used for general Windows programs such as Paint Shop Pro, Microcap V, PSPICE, etc.

I believe the approach of finding the file first, then loading the desired program is from 10 to 100 times faster than GUI programs.

I would be happy to share the code if anyone is interested. It runs in Borland Pascal and compiles in TP6, TP7, or BP7. Some of the directories are hard-coded in various places, but I could put them all in an INI file. It would take a while, but if anyone is serious about trying it, I would be happy to do it.

You have to be currently running Win 3.x, and be able to program in Pascal. I could not possibly satisfy all the requests for program changes for those who could not do it themself.

My next problem is to figure out how to do the same thing in Linux:)

Regards,

Mike Monett

This utility was talked about in the latest PC Magazine...

Ad-aware

That apparently tells you about spyware on your system. I have downloaded
it, am using it, but cannot vouch for its usefulness yet.

I've used a grid-dip meter a few times, but I'm no expert. I can say that you want to couple to the circuit under test as loosely as possible. In other words I wouldn't put the dip meter coil any closer to the coupling coil on your antenna than is necessary.

The reason is that you'll get a capacitance coupling between your dip meter and coupling coil that will cause other resonances to show up.

John

This thread seems to have generated a bit of interest since I have been at
the beach
There is no reason why the 9852 could not be used as we are only using one
output
I have done some schematics which I have sent
I can post these as GIF (5 files) if people want
Some comments from the group
Why not use the 9854/2 comparator instead of another chip?
Could the Minicircuits LPF could be replaced with discrete components? This
would be somewhat cheaper and about as simple board wise
I note the comments on the ERA-5 and current sinks to cancel regulator
noise. This citcuit should be used on the supply to the loop integrator

Cool, I stand corrected! I would have thought it was just a matter of
improving the Q (which definitely is another benefit of the
multiple-diode-set approach).

That's interesting. I've noticed on my own prototype that the
out-of-band noise performance at 2 GHz is almost as good as it is at 1
GHz, and was wondering why.

I've got the QEX CDs but not the QST ones (yet)... if the .PDF file for
that March 1995 hybrid-synth article were to magically appear in my
inbox, it would be most appreciated. (Or on the fax machine at
425-893-9111). :) I'd like to see what his approach was, having just
'discovered' the Digi-Key crystal filters myself.

Michael makes an important point -- people often sacrifice a lot of quality for small size. The "Optimized" QRP transceiver I described in August 1980 QST catches attention because of its size, but no compromise of any kind was made in its performance for the sake of size. It's a very usable rig, which I still have, and it's worked all states (all confirmed) and 33 countries -- in addition to providing countless hours of ragchewing. (It didn't take 20 years to work the states and countries -- that was done many years ago now.) But small is cute. One of the cutest I've seen was a rig built into a 9 volt rectangular battery shell. I have no idea how it might have performed.

In the non-too-distant future all services provided by radio broadcasting, entertainment, education, news, will be available only over the Internet.

All computers capable of being connected to the internet will, by law, have built-in spy-ware. What you do with your computer, what programs you listen to, what TV programs you watch, what messages you send and receive, who or what you vote for will be permanently tapped.

Amongst the other present means of communication between individuals, amateur radio will be prohibited on pain of imprisonment or death, or just withdrawal of Viagra and other contentment medications.

Indeed, everything you do, wherever you are on this Earth, will be immediately and continuously monitored by Big Brother's = CIA's super-computers.

They who own and control the World's communications systems, terrestrial and via satellite, will rule the Earth.

And there's nothing you or I can do about it. Or will even want to do about it. So much for the continuing evolution of the human race.

Not sure where my radio is, but I have one of the flashlights here
too, and it appears to use a normal motor.

I know the radio (at least my small one, not sure about the larger
model that's available) doesn't have this feature, but the flashlight
has a 3VDC output jack on it.

There is some possibility we are heading in this direction. I think
knee jerk reactions to the recent terrorist actions and threats do
make this sort of big brotherism more likely to evolve.

So far, there are some good signs that we are stopping the worst of
it, at least in the US. NSA tried to leverage some of their own
hardware into PC's and other communication devices a few years ago,
but didn't pull it off. Hopefully freedom of speech and other US
rights won't be thrown out in the next few years.

One thing we have going in our favor, is that even if it all is
tapped, the volume of information is a little daunting. Of course,
that doesn't mean some organisations won't want to try.

Sorry, I spoke too soon. I meant that I haven't put anything about it on the web. A search for "Optimized QRP Transceiver" brought a handful of hits, including some modified versions, and a reprint of the ARRL Handbook version of the article. You can get the latter from http://www.arrl.org/tis/info/pdf/93hb3037.pdf. Do a search to get the others. You might get some additional ones by changing the spelling of "optimized" to the Queen's English equivalent "optimised".

How about somebody designing a QRP Transmitter add on module for the PCR-1000? Use the PCR synthesizer, filters etc., to generate SSB and CW QRP signals. Now that would be quite a QRP rig, with a killer receiver for a change. Probably not that hard to do. Laptops these days are cheap.

I would use the low noise power supply trick on both the loop filter components and a second one on the VCO itself. It's been my experience that any wide tuning range VCO is surprisingly sensitive to it's DC feeds and usually any sort of LC filter is not good enough.

You can use the same ultra low noise source for the loop filter and the VCO, it's just my habit to separate them so the current pulses of the charge pump can't sneak into the VCO.

One of the ones I dealt with had 14MHz/Volt sensitivity on the Vcc line... And of course, there were a hundred microvolts or so of 60 cycle getting through the normal regulator circuits.

Screwed up the output something fierce....

I note that RadCom, QST and SPRAT have published a number
of relevant articles - analogue phasing rigs, DSP phasing
rigs, polyphase rigs, Weaver rigs, and so on.

Good as it is, a lot has happened since Solid State
Design was published. It would be silly to ignore
20+ years of technical development...

We're still going back and forth on a couple of tweaks, so it might be a
few days before the schematics are fit for public consumption. I just
swapped out the 180 kHz ceramic filter for a 25 kHz crystal filter,
which thinned out the spur population dramatically (see two large
zipfiles at the bottom of http://www.qsl.net/ke5fx/synth.html), and
we'll probably go back and add one or two of Wenzel's power-supply
cleanup tricks to the VCO and loop-filter supply lines. We were also
debating whether to use the AD9852/4's built-in comparator versus the
separate LT1016, which works better with low-level input signals but
needs a separate package.

The preliminary schematics are very well-done, though -- Richard is
doing a great job on them.

Hello, Laura,

I agree ... it's silly to ignor 20+ years of technical development.

I saw mention of the MC1496 in an earlier post in this thread.

That was a pretty good device in 1975 when I was designing
military SSB gear for a living, but I wouldn't DREAM of using
it today, if for no other reason that I would be concerned about
the future availability of replacement parts 'cause it's so old.
I haven't checked, but after 25+ years, I'd be surprised if they're
still being produced.

73 and nice to see you on usenet ... it's been a while,

Carl - wa6vse

none of the above are 9 mhz Filter type designs, which was what was
asked for, and therefore do not count in this instance. Even though
they are useful methods of generating SSB.

Well, you know, I work for an Advance Wireless Technology Group, and with
the exception of DSP and high performance ADCs and DACs (I'll through
DDS in there as well) the main advances I see are:

- readily available reasonably piced packaged mixers, e.g. SBL-1
- the ERA/MAV/MAR and similar amps, just add decoupling caps
and power.
- the abundance of inexpensive micro-processor crystals which several
people have turned into excellant crystal filters
- high performance OP AMPs. BurrBrown makes some with quite high
IP3s that don't drop off until 20 - 25 MHz.
- synthesizers and low noise oscillators for the LO

but you know, an op amp speech amplifier feeding a mixer with a simple
crystal oscillator couple with an ERA or MAR amp and a home brew crystal
filter makes a nice little modulator. If done right I would put it up against
the phasing method or weaver method. In fact this is what I've chosen for
my present project despite readily available samples of the best ADCs/DACs
and DSP systems available (and I don't just mean commercially).

If I really wanted to ride the the technology curve I would be using DSP -
for close in filtering and signal conditioning after some good analog filtering.
However a well designed analog receiver with good filters will out perform
a DSP based system unless it too has good analog filtering.

The fundementals of designing a good RF system just haven't changed
since Solid State Design for the Radio Amateur was first published.
We just substitute single chip components for the mixer and amplifiers these days.
The unfortunate thing in referencing Solid State Design for the Radio Amateur
is that so many of the parts are no longer manufactured, e.g MC1350 IF amp.

To me, its getting harder and harder to find good IF amps and AGC for the
receiver. ADI makes some but these are expensive. Who else makes
variable gain IF amps with the kind of performance suitable for high performance
HAM gear.

As for those cellular handsets, well they have integrated alot of analog stuff
together but their performance doesn't come anywhere close to a
decent HAM rig.

I'm on a cable modem and the page loaded fine for me. I'd say you have a problem with your 'fiber', your browser, or something other than the web page Skipp.

1. At least he doesn't top-post (corrected on this reply) :) :)

2. I would guess it is a fair bet that MANY people do not faff about with
setting up mail clients. You visit a website, if it works it works, if it
doesn't you abandon it and visit a site which works with your default
settings.

I'm afraid expecting ANY potential purchaser / enquirer to go out of their
way to do business with someone is silly. In much the same way that many of
the new sites which INSIST you use FLASH plugins or toddle off - are finding
that, surprise of surprises, their "stickyness" decreases as their
competitors pages get the traffic.

It is staggering how many large corporations seem to employ "Sales
prevention officers" these days, sadly the little guys seem to be doing it
too now.

I'm not too worried about the good old MC1350P, myself. It is still available at a LOT of vendors -- findchips.com lists no fewer than seven vendors for it, most of whom actually have stock. I feel more comfortable using an MC1350P in a new circuit than, say, an ADF4112 phase detector chip, which is current production but available only directly from Analog unless you want to buy a tube of 96 from Future/Active.

I suspect the MC1350P will become "impossible" to find around the same time a 12BE6 does.

Hi Bill,
The Phillips TDA1572 is a good IF subsystem. This is the device
that is used in the AOR7030. It has a buffered 50 Ohm output for feeding an
SSB detector, and FM detector, etc. I have been using this device for a few
years. For an AM only receiver, the TDA1072 is a good choice. I played
around with the Analog Devices AD607 for awhile, but it is a very finicky
device to work with. The noise figure on the AD607 is pretty poor, at 18dB,
so I scrapped the idea of using that chip, in favor of the Phillips devices.
It seems that the cutting edge receivers are the software defined types.
Still on the drawing board at many companies, but Rockwell-Collins has a few
under their belt.

Looks like you are really making progress!

I am still unclear on the overall architecture. You mentioned using a
mixer in a previous post, but I don't have a picture of the overall
block diagram in my mind to see how the loop works and what role the
DDS plays.

The 25KHz filter means the DDS is restricted to a narrow tuning range,
presumably around 10.7MHz. My problem is trying to figure out how the
loop acquires when you do a large frequency step. If the DDS is driven
from the 1 to 2GHz vco through a divide-by-n, the output of the DDS
will fall outside the filter bandpass and you will lose the signal
into the pll. But this does not seem to be the configuration you
described.

I'm sure the schematics will explain the mystery, so I'll be patient
while you dig for those last few dB:)

Best Regards,

Mike Monett

So what can be done about "flash-harry" - apart from just ignore them and move on, as they seem to want all their potential customers to do?! One website I visited proudly boasted "automation experts", they got very snotty when I pointed out the difficulty their Flash-Harry pluggin caused - a couple of weeks later I got a "denial of service" attach virus simultaneously e-mailed to me along with everyone else in their address book, they were most indignant when I pointed this out to them and I had to explain several times before they understood that there was a problem!

BTW: I try to get away with not bottom-posting for as long as possible, I can see the point about having to read up & down to follow the context - but an increasing number of people seem to be interleaving paragraphs just lately, which rapidly congeals into an even worse untidy mess! My argument against bottom-posting is; it takes 5 times longer to read all the messages in a thread if you have to keep switching between which pain (sorry - pane!) to scroll down!

And I certainly hope the individual with the .edu domain - is one of the student's who's yet to learn and not one of the tutors who one would expect to have already done a bit of learning!

Yes, I have noticed that, Roy. One of the complaints I have about QRP is that most QRPers seem to equate low performance with QRP. Was playing with my TS930 the other day, and it can easily get down to 1 watt (although I don't trust the power meter at that level). That's certainly high performance QRP. With some of the new ICs out now it would be possible to have some decent performance in a compact package.

What prompted my original post was the article in CQ (Feb. 2002) concerning 'survival radio'. The author wants to have another competition about small size radios and personal beacons, perhaps only a fraction of an inch in volume.

And, yes, I fully realize that a compact rig is more of a novelty, but if you can actually use it, so much the better.

That is not at all clear - my reading was that the
original poster was looking to build an SSB exciter
and had found one that looked promising. That he
wanted to build the exact design from Solid State
Design is not at all clear, and in 2002 there
are better (certainly more reproducable) ways of
doing it.

1033. Calculating coils for 120mhz

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-04 18:05:50 UTC
From: "john.bean1" <john.bean1@ntlworld.com>
Message-ID: <e3A78.12557$XS6.1653481@news2-win.server.ntlworld.com>
Source record: 46675

Hello to everyone

Could someone please help me?? I am trying to calculate the required number of turns needed for a coil to be resonant at 120 MHz. I have tried 2 formula's , one comes up with 0.246 turns and the other is 0.803 turns. Clearly this is wrong as you can not have a coil with a 0.2 or 0.8 turn. Could someone possibly tell me where I am going wrong!

> DDS plays.

The DDS is the loop reference. The worst-case DDS tuning range required to bridge the gap between N (programmable PLL division factor) steps is simply DDS_freq / Nmin.

Currently I'm running the ADF4112 with Nmin=654 (the reference divider R stays at 7), so the required DDS tuning range is about 16 kHz end to end. Once I bump the DDS down a couple kHz to account for the crystal filter's behavior in my circuit, transformers, it fits into the response curve pretty well (http://www.qsl.net/ke5fx/synth/DDSRANGE.GIF).

>
> The 25KHz filter means the DDS is restricted to a narrow tuning range,

> into the pll. But this does not seem to be the configuration you
> described.

Nope, the DDS is driven by a fixed clock -- it's used as a real DDS, not a fractional-N divider. Its output never leaves the range in blue in the plot above. Inside the PLL loop, there's nothing except the VCO, PD chip with its programmable N divider, and the OP27-based loop filter that's required to interface the two. Pretty simple stuff.

(a) If you are looking for a self-resonant coil, the answer is one thing. If you are looking to resonate the coil with a capacitor, the answer is quite different. The answer also revolves around the diameter of the coil and the wire size. How about a little more information.

(b) Why are we winding a coil for the middle of the aircraft com band on a ham newsgroup?

Hello John,

About 6 turns on a 1/4 inch (6mm) former will give you 100nH .
This will be resonant at 120MHz if you use a 17.5pF capacitor -
this is well within the range of your 4 to 40pF trimmer.

Check out Reg Edwards (G4FGQ) web-site for coil design and other
useful software. You will find a link to it on my web-page (see .sig below).

Source record: 46685

Hello everyone,

Just a note to let everyone know that we have new specials up for our Internet customers on the website. Here are the current specials:

http://www.sauderelectronics.com

__Pack of 10 Silver Teflon PL259s__
Pack of 10 Silver teflon PL259 with gold tip for RG8 coax (accepts reducer for smaller cable).
* ONLY $8.00 *

__3 ft. RG8X Jumper w/PL259__
$1.00 off 3ft. RG8X jumper cable w/PL259 connector. American made w/95% braid. Reg. $5.00.
* NOW ONLY $4.00 *

__SMA Dual Band HT Antenna__
Dual Band antenna for SMA handhelds. 2M and 440MHz antenna fits the newer handheld radios like Yaesu VX-5 and many others requiring the SMA type connection. Very flexible.
Regularly sells for $14.00.......now ONLY $12.00!

PLUS A FREE GIFT with any order over $25.00!!

No one beats our prices on accessories and connectors!

Thanks for looking,

Sauder Electronics

> Yes, I have noticed that, Roy. One of the complaints I have about QRP
> is that most QRPers seem to equate low performance with QRP.

Boy I take exception to that.

Different QRP rigs have different design points. Some are designed to be as small as possible, and these do tend to have low performance. Many are designed for backpacking and low power consumption is important. These rigs will dramatically outperform your TS930 with respect to power consumption, but they may sacrifice a bit in receiver performance to get it. Others go for receiver performance, and will often have power consumption more similar to your 930 but often with a better receiver. Performance depends on what's important.

There are a wide variety of QRP rigs out there with all sorts of targets. What they don't tend to target is the bazillions of bells and whistles market which is adequately served by the Yaecomwood rigs. If lots of buttons and and features, obscene power consumption, and high price is your idea of "performance", then probably few of the QRP rigs are high performance.

QRPers tend to be a technical lot, and they do fixate on some specs more than others. You will find few QRP rigs with receiver sensitivity much higher than necessary, because this tends to involve a tradeoff in TOIP, which, operationally, tends to be much more important. Some of the low receiver power rigs will go the other way, because you gotta give up the TOIP for the low power consumption and lots of unuseable sensitivity comes along for the ride. But if you look at QRP rigs with higher receive power useage, they will tend to have far better receivers than your 930.

These aren't just sterile numbers. Operate one of these rigs next to your Yaecomwood in tough conditions, say a contest, and unless your rice box is one of the three grand variety, say a 756ProII or something like that, the little QRP box will run circles around it.

Transmitters are a slightly different matter. Spurious rejection comes at a cost in power and weight, and most QRP rigs tend to not be a lot better than they need to be. There are exceptions, of course, many designers take pride in producing a clean output, but there are limits to what they are willing to pay in power consumption, heat and weight.

Of course, there are some that are just plain poorly designed, but they certainly aren't in the majority.

There are some features I admit it would be nice to have on my QRP rigs, scratchpad memory, for instance. On the other hand, I would really like for my rice box to have a keyer as nice as Elecraft's. But each designer has his own idea of what's important.

..

I don't know any person that is "licensed for that frequency" in this country. I can't speak to other country's laws. In this country, the aircraft is the one licensed for the frequency and the operator has either a restricted third class or no operator's license at all. Since '96, the aircraft doesn't require a license either unless travelling out of the country.

Why not just use the fifth harmonic of the 25 MHz. generator? You are working with a receiver with a sensitivity of a couple of microvolts. Certainly there will be enough harmonic content to provide a usable signal for testing.

Jim

You still haven't answered the question from a previous post, what capacitance, i.e. what is the value of the variable capacitor?

If you are trying to use the standard 365 pf variable at 120 MHz you will probably find that the required inductance is way too low to be practical.

Check the ARRL Handbook.

The original poster has an Indian call, so I assume that's
where he is. That would probably impact on his choice.
One reason he might have been asking for a kit is so he
doesn't have to order from multiple places.

I have no idea how things are now, but years ago Indian
hams had quite a problem getting equipment and parts,
due to import issues. Some of the more interesting
articles I read in the ham magazines thirty years ago
were from Indian hams, as they described things they'd
built and mentioned some of the effort in procuring parts
and making do with what they could.

From a standpoint of scrounging parts, that rig in
Solid State for Radio Amateurs is probably a far safer
bet than a lot of more recent designs. It is a straightforward
design, using standard parts (except, that premixer with the
TI doubler balanced mixer). To copy it, one might have
to do a few substitutes on the MOSFETs and power bipolars,
but it may be easier finding some sort of suitable power
transistor than trying to find some fancy and recent IC.

That rig isn't unique, though, and there were plenty of similar
rigs described in the ham magazines around the same time.

One of the big costs, no matter what design is chosen, is
going to be that crystal filter. I haven't seen prices

for KVG filters recently (I gather they are still available
new), but they'd always be the most expensive component in
a rig, be it now or 25 years ago. That's why the popularity
of making ladder filters with cheap crystals.

A better choice might be a rig that used a ladder filter. Or
if someone who's already set up to sort crystals sent him
a matched set of crystals, then building a rig around that.

There's always a trade-off. Someone who feels they need to
buy a kit, and follow a design will likely pay more than someone
who can extract the basics from a design, and then use what
is readily, and cheaply, available. For someone in the latter
position, that "Universal rig" is a good start; use a homemade
ladder filter with what crystals are readily available locally (and
thus change the IF to the frequency where the crystals are, and
perhaps suffer a bit if the IF is a bad choice), find some bipolars
that can work in the circuit, and then order what isn't locally
available from Dan's Small Parts. Though I didn't check,
it looks like most of the parts, or reasonable substitutes
could be had there (except for that TI mixer!), except for
the crystal filter. And he lists a set of matched crystals for
a ladder filter.

Aloha, anyone got any suggestions for soldering weathered stranded wire? I'm trying to revive my G5RV which blew down during the last storm here. I've tried wire brushing it, sanding it, using flux...none of these work. Is there some homebrew secret for cleaning corrosion from copper wire, making it like new so it can be soldered? Some acid wash or something? Mahalo, I appreciate the help.

Years ago I had a paste that you would dip the wire into and then remove it with an industrial wipe.. From the way I remember it stinging if you got some on your hand it was acid based. I'm not sure how good an idea it would be to use it on stranded wire but it worked great for removing varnish off solid wire when I worked doing electronic assembly and had to wire transformer leads to a circuit board.

I suspect some would cringe at this but I'd probably try a bit of diluted pool acid (HCl - muriatic acid) and then wash it well with water and dry it. I think rubber gloves and eye protection would be a VERY GOOD idea if doing this.

Wire brushing to shiny copper should be sufficient - as should sanding.
The problem may be the solders they sell these days, that contain little
or no lead.

You might try talking to a plumber, and see what they use - although
their fluxes may be acid, which you really wouldn't want on an electrical
circuit.

I have several pounds of 60:40 tin/lead solder. I have never had any problem
soldering copper with it, even copper that has an oxide coating.

Plumbers flux is acidic, some more than others (IIRC eutectic is the
nastiest one) but all are neutralised by water.
I too have experienced problems with corroded copper aerial wire and I
tried plumbers flux, as I were one and had some old stock of the
stuff. It did'nt work no how, even when shiney clean. For some reason
the wire just wont tin, and yes I was using 60/40 I also tried
plumbers 'wiping' solder which is a slightly different melting point.
I've given up on trying and just waiting for the next rally to buy
replacement HD Copper.

Sorry Bill

The Capacitor that I have managed to obtain is from 2 to 26 pf , a variable
for fm use, and I have also tried using a 40pf trimmer.

Would these change the inductance greatly??

It is possible to build a good SSB exciter using 'standard' components.
My current rig has a dual op-amp as the mic amp, a pair of 1N4148
diodes as the balanced modulator and a few bipolar transistors
for the carrier oscillators. I used a crystal filter from a
scrap CB. As Michael suggests, a crystal ladder filter is
another good option.

See Aleksander Stare's web-page for some ladder filter designs.

Sanding or wire brushing down to bare copper should be enough. One
thing to avoid is acid-based flux on stranded wire. The acid will wick
between the strands and will be near impossible to remove completely.

Picture what will happen with acid trapped between the strands over a
period of time. :-(

Good points all, but, with all due respect: you're not
the original poster, and cannot possibly know exactly
what he had in mind.

I too have heard horror stories, but recent events
(like the establishment of AMSAT-VU) suggest that
the situation is not as dire as it once was. The
mere presence of VU calls in this newsgroup suggests
this too .

Hello,

Hopefully, this is the right place. I would like to build my own software for programming my 207 and my handhelds. I found the CI-v interface information on the web (http://www.plicht.de/ekki/civ/) and was wondering if this is what the 207h uses?

If not could someone please direct me to where I could find the specs, an SDK or library...

I am also interested in the T81A, W32 and T7H as well.

Any pointers would be greatly apreciated.
Thanks in advance

Stuart

1084. Pixie 2 Question

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-05 20:52:06 UTC
From: jim.bolinger@lintek.aeroflex.com
Message-ID: <8d5ec8a2.0202051252.3c27809f@posting.google.com>
Source record: 46626

I posted a question the other day asking what the 'smallest' QRP trransceiver was.

From what I can find on the net, the Pixie 2 and variants is probably the simplest (although not the best performance).

My question now is, why is a PI network used at the output?

I would think that a link coupled parallel LC in the amplifier collector lead would help reduce spurs, both transmit and receive. It would also eliminate 1 coil and 1 capacitor, as it would replace the choke in the collector path.

Or would this not work when in receive mode?

In general I wonder why parallel tuned tanks are not used more often in simple rigs because of the inherent bandpass characteristics (less AM BCB spurs).

Jim,

This is a good question. If you take a look at one of the very first ancestors of the Pixie, the Micro 80, in the G-QRP Pixie files at http://www.qrpp-i.com/pixie2.htm you will see that Oleg Borodin, RV3GM (in 1987-1992) used a parallel tuned circuit as a tank circuit only. I have seen other versions where the output is taken from a tap of the coil rather than from the collector of the output transistor, I would guess for better impedance matching.

Any number of the common epoxy glues available through your local building supplies/hardware/auto jobber will do the job just fine. Typically (with nearly anything) ensure the surfaces are oil/grease free and free of anything loose which may scale off (you'd be gluing to this scale otherwise).....Room temperature or a little warm is best for a good cure.....mechanically support the items being glued if you can (or put the structure in a secure place while it's "balancing").

Have fun....Keep on tinkering.....THAT...is Real Ham Radio

Hi John,

Thanks for your reply. I finally downloaded the datasheet on the
ADF4112, and everything is clear now.

For those who haven't bought the QEX CD yet, the article "Designing
Low-Phase-Noise Oscillators," by Ulrich L. Rohde, QEX, October 1994
is at

http://www2.arrl.org/ard/files/rohde94.pdf

Figure 15 shows massively-parallel varactors used in a tapped
Hartley FET vco.

I found Ulrich L. Rohde is Chairman of Synergy Microwave Corp.,
Paterson, NJ 07504. Some of his articles are available at

http://www.synergymwave.com/publications/Index.htm

Here is a brief description of some interesting points in the
articles:

"Synthesizers design for microwave applications"

http://www.synergymwave.com/publications/PDF/Synthesizers.pdf

Figure 28 shows a custom-built phase detector with a noise floor of better than -168dBc/Hz. However, the schematic has errors. The 'D' input for FD3 has no connection to the output of any gate or flop.

As the caption for figure 36 shows, the crossover point between the multiplied phase noise and the 4GHz oscillator determines the best loop bandwidth.

"Oscillator basics and low-noise techniques for microwave oscillators and VCO's."

http://www.synergymwave.com/publications/PDF/Oscillators.pdf

"Figure 15. Modified Colpitts oscillator with a dc-stabilizing circuit that monitors the emitter current of the oscillator transistor. Since the stabilizing transistor is dc-coupled, it can be used as a feedback circuit to reduce the phase noise from dc to about 1 MHz off the carrier. This approach is independent of the operating frequency and the device itself, and therefore can be used for FETs as well as bipolar transistors. It solves the fT nonlinearities pointed out in Figure 7."

"Recent advances in linear VCO calculations, VCO design and spurious analyses of Fractional-N synthesizers."

http://www.synergymwave.com/publications/PDF/LinearVco0600.pdf

Figure 7 shows the predicted phase noise of an 880MHz vco with tuning sensitivity ranging from 10Hz to 100MHz/V.

Rohde states:

"It must be noted that above a certain sensitivity, in this case 10MHz/V, the phase noise is determined only by the circuit's tuning diodes and is no longer a function of the resonator and diode Q."

This is extremely significant in the case of octave-bandwidth vco's! So one path to a low noise floor might be a very low noise vco operating between 250 and 500 MHz, and a wideband low-N pll to cover 1 to 2 GHz. Just for fun, here is a collection of vfo oscillators:

http://www.pan-tex.net/usr/r/receivers/svfo.htm

Figure 13 shows two methods of dc-stabilization to reduce flicker noise. Figure 14 shows the improvement, about 15dB.

Rohde covers two of the three pins in a transistor in his bias stabilization patent. I wonder which pin Matjaz Vidmar used in his article at

http://www.vhfcomm.co.uk/s53mvvco.htm

Whichever one it is, I like his approach better :)

"Nonlinear Effects In Oscillators and Synthesizers"

http://www.synergymwave.com/publications/PDF/ims2001.pdf

Repeat of bias stabilization circuits.

Figure 23. 100 MHz VCXO for ultra low phase noise applications. The HSMS2800 hot carrier diode provides noise reduction. Figure 24 shows the improvement.

More on spur reduction techniques.

Best Regards,

Mike Monett

1088. Re: Calculating coils for 120mhz

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-05 22:36:43 UTC
From: Bill Kirkland <kirklandb@sympatico.ca>
Message-ID: <3C605E7B.CCB40D41@sympatico.ca>
Source record: 46630

A previous post gave this information:

Hello John,

About 6 turns on a 1/4 inch (6mm) former will give you 100nH .
This will be resonant at 120MHz if you use a 17.5pF capacitor -
this is well within the range of your 4 to 40pF trimmer.

Unfortunately he left out the length.

Somewhere around 100 nH or 115nH is about right for this capacitance range.
100 nH for 17 pf, 115 nH for 15 pf

The formula for resonance is
f = 10^6 /(2 x pi x sqrt (LC)) where

f is in kHz
L is in microhenrys
C is in pF.

From the ARRL handbook, the formula for inductance of an air core coil
is

L(uH) = d^2 x n^2

18d + 40 l
where
L = inductance in micro henrys, about 0.1 or 0.115 for you
d = coil diameter in inches
l = coil length in inches
n = number of turns.

n = sqrt (L(uH) x (18d +40l))
---
d

If you want a VFO for a signal generator at 120 MHz then you need
to consider the effects o the oscillator.

Rhode designed a 74-105 Mhz VCO with a 92 nH coil using 4-turns
with a tap a 1 and 2 turns from the ground in a Hartley configuration.

>

jim: your problem may not be corrosion, but lack of heat instead.

that wire may be acting like a big heat sink, and if your heat source is not large enough, the heat is traveling up the wire, and the end will never got hot enough to melt the solder and let it attach to the wire.

hope this helps.....

Did you or Mr. Fritz Leiber have another of these sanity meters? I
sure could use one on daze like today!

Uh, eutectic is not a flux. Eutectic is the particular percentage of
an alloy (tin/lead solder in this case) which has the lowest melting
point and which (at least in the case of 63/37 Pb/Sn solder), when
cooling, transforms from liquid directly to solid without an
intervening crystalline state.

NO NO NO --- It was AntiSpam Test. Want to see how many spam to my alias and how I can filter things out.

Am receiving 150 E-Mails a day --- mostly spam, junk, threats and nonnsense. The usegroups used to be a valuable means of information,, now all this extraneous stuff has really ruined it and I can't give my true E-Mail address any more, sad state of affairs, but true.

Chek out http://www.qsl.net/ab0mv/molex.htm, which is apparently the older
of the two "standards" and good for up to 8 amps, and
http://www.emaares.com/ppole.htm for reference to both the 'older' and
'newer' standards.

Personally, I'm going with Anderson Power Pole connectors, and carrying some
APP-->Molex adapters just in case.

Our ARES group (Orange County, NC) has settled on a connector
available from RS. It is polarized and the female socket has the male
pins. I believe that they are the 20 amp connectors. I saw an
interesting variation in QST lately for a standard for keys/keyers
that used the similar but three conductor connector. I have the rig
in the car set up with it for easy in/easy out. I also have a set of
adaptors for my Drake PS-7 to use with other rigs using the
connectors.

Dipping in Muriatic acid works well. Just swish it around in clean
water afterwards to remove the acid left behind in the strands.
Muriatic/hydrocloric acid leaves no residue, even the HCL will
evaporate in a few minutes, but for the sake of your tools, etc., it
is best to remove it well before proceeding.

It is quite possible that the comment about insufficient heat is also
important here. It can be surprising how well a large wire can conduct
heat away.

One of the best and simplest solutions to things like this is good quality foam core double stick tape. Because it is flexible, you don't have the problem of things with different coefficients of expansion breaking apart as the temperature changes. It also tolerates parts that aren't perfectly flat. I haven't found anything yet that it won't stick to, as long as it's smooth and clean. (It doesn't stick too well to cinder block.) This stuff is easy to use, and you can put the rest of the roll back in the drawer and keep it for the next job. Just cut it with scissors to make a patch that will sit on the bottom of your coil mount and stay out of sight.

The 3M stuff is exceptionally strong.

You might try silver polish; I've even been able to
solder aluminum through a "puddle" of polish.

Looking for any good info on converting the Radio Shack TRC-509
49.830MHz single-channel HT to 6m. My local Rat Shack was getting rid
of the last of its stock for $5/each, so it seemed like a nice way to
get a fair bit of a small 6m FM rig prebuilt for dirt cheap :)

It appears to use a 3rd overtone 16.45833MHz crystal for RX, (455kHz
IF) and a 3rd overtone 16.610MHz crystal for TX. Has anyone already
done this, and run into any snags with just swapping the crystals and
putting a BNC in place of the stock antenna?

I'm thinking about possibly adding a small (1W or so) amp and putting
the whole thing in a bigger case. Any recommendations for amp plans
to go from its stock (50-100mW?) output to 1W?

The text I could not read at first, reads: "for our civilization".
Obviously, you would have to match with whatever civilization this meter was made for otherwise you would get erronious readings. It works of 110v, so maybe it means US civilization. Maybe the manufacturer made export models for each country. I've only got one Meter. Must be pretty rare these Meters.

Thank you all for the valuble messages posted in response to my query. When I was in college, I built a SSB transmitter operationg on the 7MHz band, using the 9MHz filter method of SSB generation. Since then it was my long cherished dream to build a SSB transmitter operating multi-band. From the various messages posted, I learn one thing....I am far away from current technology. I have not been active on the air for almost 10 years now as I work in U.A.E where foreigners don't get reciporocal licences! Anyhow I don't give up my hopes. Should anyonwe have more info or advices, please let me know.

Finally, just a clarifictaion. Yes, I am an Indian, and getting electronic components in VU2 used to be very hard. Honestly I don't know what's the situation like right now,but presume its still tough!

Cheers

Our local ham club had a handout on this once when doing a program on
emergency communications. I thought it was such a good idea that I converted
the power cords of all my 12 volt equipment and power supplies to use them.
Anything I have that uses 12 volts can either plug into my car or to my home
power supply.

I have a cluster of 5 connecters in the car and 6 on my home supply, that
way I can keep my 10 meter rig, 2m ht, and 2m amp connected in the car all
the time, and then have my other 10 meter rig and 2m mobile at the house.
But if I needed to, I could swap radios from one to the other.

I can also power my anntenna analyser with the car power, etc.
thanks, John.

I use the 2 pin molex connectors from Radio Shack. They have 2
versions. Be sure to use the larger one that is good to 20 Amps. I
always make the pin at the pointy end positive so it's easy for all in
our club to remember (P oint = P ositive). Also, use the female pins on
the cable side coming from the battery because its pins stay fully
inside the connector so that when the cable and radio are disconnected
and you're driving around on bumpy roads, the pins can't accidentally
contact ground and blow a fuse or burn up the wire.

Had an old VF-1 that had started jumping frequency. Never
liked that unit, but there it was.

Replaced almost every part in the darned thing. Turned out
that the Litz wire (you all remember Litz wire) on the big coil
had become unsoldered, even though it looked soldered.

Now I am back on with a steady, well drifty, signal.

I still don't like that unit.

Had to tell someone!

Just go get you a "disposable" email account and use that as the
"posting address" then set the filters on the new account to reject
"EVERYTHING" as in filter for your new address and send it to
the trash. Then you get no spam at all, or any thing else for that matter.

I get between 15 to 25 spams a day at my yahoo.com address,
most of which go to the trash automatically. That's why I have the
email you see on this post. Plus it looks like it's been made up
to avoid spammers (little do they know it's real). Been working
real good so far.

How will you know which are coming from your " old" nom de 'net and
which were generated by this one ?? We're all prisoners of our ISP's. If
you have only one then de-spamming is difficult and time-costly. Keeping
2 ISP's won't eliminate spam, but will allow you a littel more control without
quite as much effort (use only one for usenet and block everything). Trying
anything other than fairly obvious address-munging quickly gets to the point
of diminishing returns -- remember, they already got your real address years
ago before you wised up - now they sell the list it's on all over the internet.

Spam is like a wife that won't cook or clean: You can give 'em the hell
they deserve for their laziness, but you're only gonna pay for it down the road.
Either in paytback or (more likely) endless nagging headaches that take up
your time and rob your sense of peace. OTOH, zero effort will only draw more
fire your way (or worse, she might try to " improve" you). To me, the wisest
path seems to be to take a * low * but determined stance from which you
never retreat regardless of appeals to reason or common sense. Yet still,
project a watchful, but tolerant, attitude to her incomprehensible being-ness.
Then claim that spending money on Ham Radio Goodies is the only thing
that keeps your sanity, so she better not complain about it (though she will).
I admit all this is flawed, but it's the best I've come up with so far. (sigh)

I will be getting a new ISP and address within the next couple of
weeks and have been wondering how to set it up to avoid spam and yet
let people on the usenets contact me. Any recommendations?

Jerry W4UK

Hi Andrew,

Hot glue gun. If you don't have one, local hardware or craft store can fix
you up real cheap. If you don't think that's strong enough, 5-minute
expoxy will work great. And it will be industrial strength.

Best regards,

Steve Robertson

I can't answer your question but I would love to hear if you get this project working. I have thought about snagging one of those little HTs but keep forgetting to each time I step into radio shack. There was another ham that converted one of the cheaper 49Mhz kiddie talkies over to 6m by just dropping in another crystal which you couldn't really do here. Since FRS has taken over, these little 49Mhz walkie talkies should be coming down even lower in price. Hmm.

Haven't seen the connnector that you are talking about... can you give us some more info:

Do you know the Molex part number (for the plug / receptacle / pins)?

Do you have a choice of which plastic shell receives the male and female pins? If so, which way do you wire them. (I know there are hints below... but it is not absolutely clear.)

Yes.

> for the coil mount for a one-off crystal set and does not need to be
> " industrial strength."

Foam tape (as someone else suggested) is probably easiest and fairly
removable if need be.

I like urethane glue. Glues just about anything to anything. No
mixing with accompanying problems if the ratio is a bit off.
Waterproof after cured, but moisture cure, so if gluing non-porous
objects (like metal to glass) a spritz of water is used. Expands
slightly as it cures to fill gaps or force into porous materials
(like concrete block), so hold tight while curing (a few hours).
Sandable and takes stain.

Only disadvantages, cleanup off skin can be nasty, uncured it is
generally irritating to skin, and the vapors are nasty.

Elmer's has a variety I've used, purchased from Home Depot.

Gorillaglue.com is another brand. (I've seen but not tried)

And re. thistothat.com, they recognized gorilla glue as the "glue of
the month" in Feb 2000, and a different one on
http://www.thistothat.com/gom/2000.07.shtml which also sums up
advantages and disadvantages and has some good links.

I second the power pole's. If you appreciate elegant engineering
that "just works" easily and smoothly, you'll like the power pole.

One shell available in many different colors, genderless (you create
your own 'gender' by assembling multiple shells into a multi-pole
connector), and interchangable contacts in 15, 30, and 45amp (for
different wire sizes) means you can afford to stock connectors and
to make all the cabling and adaptors you need.

I've found that the metallized bags such as are used to protect our
expansion cards, hard drives, & etc from ESD are quite capable of
attenuating the alien rays. The larger ones fit nicely over the head,
and are semi-transparent so that one can pull the bag completely down
over one's face in event of a deluge attack.
Say, why don't you open the case on that Sanity Meter? Maybe some
pictures of the circuit board could help recreate it. I think that a
good, working Sanity Meter just might be the answer for detecting when
the alien rays are present. I really hate to wear my ESD bag all the
time.

Well, in theory, it should just be a matter of swapping the two
crystals for the right values. Getting crystals of those values, OTOH
appears to be a bit harder, depending on which frequency or pair you
want.

I'm fairly confident that if I can track down the crystals I need,
I'll be able to get it onto 6m, I was mostly hoping that someone here
would know how to squeeze a bit more power/efficiency out of it once
that's done.

I've had some coils where a couple of the strands had broken at the
joint and it seems to make a difference. Not earth-shaking, but a
difference nonetheless.

Thanks, I found that page during a search too, but Motorola doesn't list many
MRF part numbers anymore, so they may have discontinued the whole line, and
I'm not sure what the actual demand might be for these, whether anyone even
uses them anymore.

Forget about using a torch. It will burn off your flux leaving a mess. Use an large iron. Scrape or use fine 300-400 grit to clean to bright copper. You may have trouble with some steel if you go too deep into Copperweld though.

There's no particularly good answer to this.

NEVER, NEVER, NEVER put your email address in a public place. Configure
your newsreader with a non-existant address - I use "me". If your
newsreader forces you to use a syntatically-correct address I'd use
something at 81832.com. (a Chinese ISP that harbors spammers and deserves
every piece of spam they'll get if you do that...)

DO NOT put your email address on your webpage. At least not in text form.
There was a hint in QST a few months ago about putting it up with
JavaScript. It's a bit easier to use Windows Paint to draw a *picture* with
the text of your email address & put that picture up.

NEVER reply to spam or use the "remove" address. If you're reasonably
confident you know what ISP the spam was sent from, or that any websites
mentioned in the spam are hosted by legitimate companies, it's worthwhile to
send copies of the spam (with all headers) to "abuse" @ those ISPs.

Don't join any mailing lists that post archives to the Web, unless those
lists also hide all email addresses in postings.

You probably can't prevent it altogether.

People you thought were friends will put a "send email to my friend Jerry"
link on their websites with your email address on it. You'll join a mailing
list with no archives - and a spammer will join the list just long enough to
steal the addresses of the regular posters.

Spammers who spider the newsgroups for addresses seldom download the article bodies, instead taking just the headers. If your address does not appear anywhere in the headers, fewer spammers get hold of it. This has been experimentally verified by several people. So it's *fairly* safe to put your address in your .signature.

There are also tricks some people use. I'd give credit to these clever folk if they were easy to find; instead, I'll just give plagiarized examples:

From: address - fredpants@example.com
.signature quote - Drop pants before replying

From: address - joDELETETHISe@example.com
.signature quote - Do the obvious thing to my address to send me e-mail

Spammers DO have spidering programs that remove "SPAM" and "NOSPAM" from addresses; don't do the obvious, be creative. Also, this aggravates some people who don't like address munging.

Jerry: I came to like mine. I had to completely rebuild it. I told people that mine had been built by a psychotic, soldering school dropout. I tore it down completely and started over using just the schematic. I ended up using more terminal strips than Heath did, and I think my version was more stable than the original.
Cool green dial. Sme VFO as they have in the DX-100.

I thought the ARRL standardized on the 8-amp connectors (RS 274-222), and
that those wouldn't mate with the 20-amp jobs...?

I still have the issue of 220 Notes that gave the details.

I used to use an analog ohmmeter as an IQ meter in high school. I'd touch the leads to the other person's temples and get a small reading, then I'd touch them to my temples and get nearly full-scale. Of course I never found it necessary to mention that I was squeezing the probe tips hard when I touched my own temples. Rx10K or Rx100K worked well.

The RS part number for the 8 amp connectors (a set of male and female) is 274-222. The male pin goes in the female shell and the positive goes to the side with the point, as was posted here earlier. The RS number for the 20 amp connector with the female shell and male pins is 274-151. I don't have the RS number for the mating part and RS Online isn't cooperating in my search. I do need to get a couple of the female connectors, so I'll post again with the number. I think the 20A part is better because it will carry the current needed for most 100W transceivers. I would like to use the Anderson Power Poles, but the RS parts are probably more readily available and have been standardized.

For sale: Geo. Stevens Coil Winding Machine

This benchtop coil winder is suitable for prototyping or small production work. The foot pedal provides precise variable speed control. The winding direction is switch reversible. The turns counter hands show one turn and 25 turns per division respectively, providing fractional turns accuracy even for coils having hundreds of turns.

The winder is 18" wide x 10" deep x 16" high. This winder has provided many years of reliable service and is still going strong! Includes two mandrels, supply spool tensioner and large spool holder. Shipping weight is 75 pounds for the winder and 25 pounds for the accessories. $199 + shipping.

See picture at www.mfr-eng.com/for-sale/winder.gif

Folks,

Just trying to get back to hardware experimentation after a long hiatus.
Wow - things have changed in the last 15 or 20 years!

I'm trying to gather a few parts for experimentation. I've noticed that
transistors are available in both 2n and PN varieties, such as 2N2222 vs
PN2222 and 2N5179 vs PN5179. The PN's seem to be cheaper.

What's the difference between the two?

Thanks and 73,

Tom AB9B

LOL! I used to work traffic nets using one of those things. After the NCS would send me "up 30," folks would complain to the NCS that they could't find me. Heck, it looked like "up 30" to me. But on Mondays, it was probably "up 10" and on Fridays, probably "up 50."

I think the VF-1's frequency scale was the perfect random number generator! <g>

Very 73,

Tom AB9B

The PN is in a plastic package, the 2N is metal. The internal chip is the same. The 2N will dissipate more power than the PN, and will have a little more capacitance from the collector (connected to the case) to the outside world. For most purposes they're interchangeable.

No, I think you have got it wrong. Aliens are not part of the equation. The Sanity Meter is a product of the Cahill-Thomas Manufacturing Co. If it emits rays, they are not alien. If may actually receive, i.e. detect brainwaves, I'm not sure. I think to be absolutely certain no-one is reading your sanity, I think you must continue wearing that ESD bag over your head. That, or keep an eye out for any Sanity Meters in your immediate vicinity. But who says having your sanity read is a bad thing. You may actually benefit from having a Sanity Meter reading I think.

Info from the 1991 edition of the Motorola Electronic Master Selection Guide

MRF138
Pout (W) 30
Pin (W) 0.6
Gps (db) typ 17
@ f (Mhz) 30
IMD d3 (db) typ -34
IMD d11 (db) typ -60
VDD (V) 28
Frequency Range (Mhz) 1.5 - 150
Polarity N-Channel
Package 211-07 (380 SOE FLG)

Looks like it would make a heck of a QRP transmitter final or high power driver.

That isn't quite true. PN are indeed plastic packages. 2N are whatever the EIA standard shows, and often that's a metal can. If you talk about the 2222A and the like, yes the 2N is metal can.

Years ago a mechanical engineer told me that plastic transistors can dissipate
heat better than transistors in metal cases, due to the black body effect.
I can't claim that he was correct as it is counter-intuitive.

Heat is transferred by radiation, conduction, and convection. The black case only aids radiation, which isn't a major contributor until the temperature gets very high. (As I recall, the radiative heat transfer goes at something like the fourth power of the temperature.) The larger can of the metal transistor, coupled with the low thermal resistance between the collector and can, aids convection. If a heat sink is applied, the metal can and low thermal resistance aid conduction to the heat sink. Plastic transistors depend largely on conduction of heat through the leads. Data sheets for the transistors, now readily available on the web, will tell you the details.

I apologize for not being more clear. I was referring only to the specific types the poster mentioned. Those two 2N types have a metal can. As Bob says, 2N transistors are ones that meet an EIA standard, and they can have whatever kind of case the standard for that type calls for, sometimes plastic. (For example, the 2N3904 and 2N3906 specifications call for a plastic package.) Some manufactures take the same chip used for a 2N metal cased transistor like the 2N2222, put it in a plastic case, and give it the PN prefix. Because of the alternate package, it no longer meets the EIA specification so isn't given a 2N number.

That would be 274-154, IIRC. Funny thing is, radioshack.com is
claiming those parts are an 8amp rating, just like 274-222. So I'm
not sure...

> 100W transceivers. I would like to use the Anderson Power Poles, but
> the RS parts are probably more readily available and have been

The 20amp are not standardized. The 8amp -were- but are they still
the current standard? I thought it had changed or was changing.

The simple solution is for -you- to use the better connector, and
make a couple of adaptor cables. The APPs are *significantly*
better. Not quite as available, but well worth it.

But if you hook a radio drawing 18 amps to the adapter cable thus pulling 18 amps thru both sets of connectors, the 8 amp connector will as a slow blow fuse (if your lucky, as an electric match starting a fire if not) causing no end of problems. The real solution is to wire in two sets of cables, one standard, another hi power for high current radios. None of my equipment will do over 45 watts so I can live with the standard connectors, and honestly I don't work mobile very often over 25 watts. You don't want to be pulling major amps thru a string of marginal connectors.
thanks, John

Message-ID: <44ea7c25.0202071952.60e20960@posting.google.com>
Source record: 46513

Hello. I am looking to homebrew a 70cm 1 watt ATV amplifier. The input is from a Ramsey 100mW TX and would like to boost it up to ~1 watt or a little more. Since it's for ATV, it needs to be a linear amp. I am looking for recommendations on readily available transistors at a decent price. Most likely the final version will be surface mount with a possible exception in the type of transistor package. Resources on FM amplifiers are easy to come by, but I am have a difficult time on a linear version. The input voltage will be ~12V and input/output impedance will be 50ohm. Any help would be appreciated. Thanks in advance.

Not just consumers with a sense of humor. I once was at the hardware
department of an unnamed store chain (with its headquarters in the
Sears Tower in Chicago).

When I asked the salesman the difference between the $40 electric
sander and the $70 electric sander, he told me that the $70 one was
"much, much better". For this he gets a commission?

Happy trails,

WARNING: SHAMELESS ADVERTISEMENT ALERT.

(Hey, at least I'm honest about it...)

Now that I've finally got my shop together, I think it's time I started to let the ham community know that I am ready to offer small-volume RF services to those who may not have the test equipment, tools, skill, or time to do it themselves.

My specialty will be conversion of older Motorola radios to ham service. However, I am also licensed to make such equipment operable on commercial frequencies (FCC General Radiotelephone + Radar endorsement). Besides the licensing, I spent seven years with Motorola's Comm Sector, and I've got nearly 25 years as an active hamateur under my belt.

I can offer basic test & checkout, recrystalling, alignment, modifications, and minor repair. My base rate is $40/hour with a half-hour ($20) minimum (I think this is at least competitive with the commercial shops). I can also offer a special rate for basic checkout only of $10.00 per radio.

Please keep in mind that I'm still building up my lab, and my stash of manuals and test gear. There may be radios that I cannot service at this time. Mobile-wise, I'm set up for (Motorola) Motrac, Motran, Mocom-70, Micor, Mitrek, and the first-generation Syntor. I can also handle MT500, MX (non-synthesized only at this time), HT90, HT440, and RF Link units.

As time goes on, I hope to add capability to service the later radios such as Syntor X/X 9000, Spectra, Maratrac, and others including GE.

I can be reached at the human-readable address in my signature block, or as sales (at) bluefeathertech dot com.

Thanks for reading.

HP's first audio oscillator was the 200A. I've never heard
of a 200T, FWIW. I have never heard of anyone collecting
HP test equipment as collectors items (as opposed to
it being useful as test equipment) except the HP archives,
the Agilent archives, and a few museums, mainly in Silicon
Valley. And I haven't heard of those museums having to
pay any significant money for old stuff. Recently HP
bought the "Garage", but paid market price for it (only
$1.5 million, which is ho-hum in Palo Alto).

Tell your friend to donate it to a museum for a tax writeoff.

Hehehe. Yes, I was reading Robert Sheckley's , "The Academy" (1954) which is a story about a society that after world war destruction decides that the best way to preserve peace is by maintaing the status-quo. In other words, society guards against any original thinking or persons with ideas. I suppose they associate people with ideas or big plans as being dangerous for society. Hitler for instance or Pol Pot would have come into that catagory. So, they invented the Sanity Meter, and above a certain level you had to attend The Academy. Problem is, that place has a claimed 100% success rate but no-one ever comes out of it. And if you ask questions about it's methods or it's policies you are looked upon as being a trouble maker. In the 50's a lot of stories came out piting the individual against controlling governmental set-ups. Just thought I'd see what response I got to asking for the Sanity Meter Instruction Sheet. Obviously a joke posting.

I'm not really a science fiction buff, but I do like Sf. What is "Infinity" about?

Rich.

Actually, they are not too bad, if you like building your own. They are 30
Watt 2.0 to 175MHz N-Channel Mosfet Linear Power Amplifier transistors.
Power gain is 17dB, with a typcal efficiency of 40%. They are 100% tested
for load mismatch at all phase angles with 30:1 VSWR. The only downside, if
you can call it that, is that they are a 28 Volt device.
It would be great for a power amplifier in a low power transceiver. I don't
need any of these myself; I have a ton of RF devices!

Source record: 46530
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hi all,
I took the 10544 oscillator out of an HP5245L counter. I also got the small plug in card that was next to it, which seemed to be hooked up to the 'timebase output' switch on the rear of the counter. The switch allows a user to select one of several outputs (10, 1, .1, etc MHz). I think the oscillator itself only puts out 1.000000 Mhz (at something like -20 dBm), so the card must have some multiplier and buffer stages in order to get 10 MHz.

Anybody have a schematic of this little plug in card? I would like to use the oscillator and the card in a small high accuracy frequency standard for my bench.

Thanks,
Tracy

> where I can find one?

Well, it's not what I thought it might be, one of those TI readouts with
a latch (and sometimes counter) built in.

It's just an average .3 inch 7-segment readout., common cathode,
with the decimal point on the right. Look it up in an ECG
replacement guide. You can buy an ECG replacement, or look through
some of the catalogs until you find something the right size, and
check if it's a match. I don't know whether it's deliberate or not,
but my experience is that there is fairly standard pinout on LED
readouts, so most likely you only have to verify that it is the same.

If this is to repair something, you may find that it will look
different from the other ones in the unit. If that's a problem,
replace them all (though, I wouldn't use ECG replacements because
of cost if doing this). If this is something new you are building,
you have a lot more potential. As long as you don't pick something
that draws too much current, you could use a bigger readout, which
might be more readily available. You can pick another color (though,
red is most likely to be available). If it doesn't need the decimal
point, where it is won't matter.

AFAIK the 10544 is a 10 MHz oxco from the 70's. It was later
replaced by the much better 10811. I have an old 5245L and it uses
neither. It has a 1 MHz xtal in an oven with an external oscillator
circuit. Maybe on late versions of the 5245L they offered the 10544
as a high stability option.

Can't help you on the circuit board. Any documentation I might have
would be for the old 1 MHz oscillator.

Infinity is a SF poem that I found in the year range '69-'73 in one of
the anthology books; Best SF of xxxx, or Worlds of IF, or maybe Ben
Bova's NOVA series. Shoot, I just don't remember, Best SF of xxxx is
prolly the one, tho.
The only things that I can remember about it are the title and the
last 6 words, which are (so ya don't have to ask 8>):
". . . and Christ hangs upon another tree."
I've been haunting second-hand bookstores, libraries, fleamarkets,
yard sales, and SF meets for at least 20 years hoping to find that
poem again. Even the author's name would be a help.
Do you have any clue at all?

thanx
Bob
kc8hpg
BTW, are you a radio operator, sir?

Thanks for the response,

This is odd. This particular counter seems to have been factory retrofitted with the 10544 oscillator, but I looked at its output and it is defiantly at 1.0 MHz. There is nothing at 10 or even 5 MHz.

Thanks,

T

I don't fabricate my own SMA cables; they are too easy to come by
ready-made on eBay. You can buy plugs and jacks from
http://www.digikey.com (see http://info.digikey.com/T021/V2/178.pdf) but
again, eBay is the best place to shop for this stuff.

Crimp and Solder types typically refer to the pin itself.
For Crimping you need (should have) a special tool which will probably
cost a few hundred $ and you will need different dies depending on the
cable.

With my experience, you still have to crimp the furrel (for the cable types
you mentioned), which is the sleeve that goes over the ground shield.
Hence you will need a crimp tool for that as well. You can buy inexpensive
crimpers for BNC connectors and you might get away with one of these here.

The only ones I have seen that don't have a furrel are for semi-rigid cables
or cables with tinned braid like suggoflex (or is it succoflex?). These aren't
cheap.

A ham wouldn't have to resort to using a specific numbered part,
flogged at outrageous prices, by vultures. That's one of the skills
you develop as a ham.

Ham organizations are also pretty good at sharing 'found' parts,
between members, to enable and encourage usefull work.

Suggest you auction them on ebay. You'll soon find out what they're
worth, today. Otherwise, bury them in a tin can for somebody else to
(maybe) find in 100 years, when they may have accumulated some
historical value.

Does anyone know for what current plain ol' banana plugs and jacks are rated?
I standardized on them for all my radios (up to 100 watts DC for HF) about
20 years ago and have never had any problem of any kind with them (other than
remembering "red plugs into red and black plugs into black"!), and now I'm
wondering if I should have been worrying all these years!

Hello all,

Introducing the "Radio Shack Special". Well, that's what I call it.

A few weeks ago I had spotted, from ARRL, an FM VHF regenerative receiver that had two transistors, 2 large and cumbersome coils, and many resistors, pots and capacitors. The PCB was rather large.

I have managed to get this receiver down to a 12 component count!

It works marvalously. I still can't believe it is still functioning with only one transistor (MPF102) and one "small" coil, and a few other components.

I put an LM386 behind it, and the quality in the headphones is an understatement!

The sensitivity, the selectivity and the great audio output is astonding to me. I have build this receiver 5 times, just to reassure myself I am not dreaming.

This has got to be the world's less component count ever!

If you are interested in making this project, I have the complete plans, from beginning to end.

All the parts can be bought at your local Radio Shack Store, except for the tuning capacitor....but that can be handled differently if you don't have one or don't want to purchase one.

While I type, there are approximately 15 people building it now.

I get about 2 e-mails a day. My end goal with this project was to try and get as many people as I can to hear about it....and then make it themselves.

There are unlimited possibilities one can do with a FM VHF receiver... I just decided to receive in the FM band (88-108 MHz), but the rest of the VHF is open!

And so, my friends, if you are a dabbler of small RF projects...this will surely be up on you list...

Welcome yourself to a wonderful journey into the world of a single transistor...you will not be the same...

My e-mail address is braincambre500@yahoocom

If for any reason you are concerned about something in the plans or
just want to let me know at what stage you are in.....on this project,
I will be happy to listen and help.

The complete plans are about 300K...

Let the project begin!

I do thank all of you for the time spent reading...

...your friend, Patrick

1207. Re: HP 200T Info

Newsgroup: rec.radio.amateur.homebrew

The 200T was essentially the same as the 200A except for the frequency range. The telemetry band back then covered from about 5 kHz (?) to 70 kHz and this oscillator was set up for about that range.

The 10544 and 10811 have identical interfaces, so any HP instrument
manual for an instrument with a 10811 will get you the info.
Alternately, you can just measure the pin voltages on the board you
have to tell you what the pin out is. There are two power supplies:
+12V @ 40 mA for the oscillator and 20 to 30V for the oven.
They have separate ground pins, so be sure to ground all pins
that are grounded in your counter.
When the oven is warming up on a 10544, it looks like a 47 ohm
resistor. There is also -5 to +5 electronic frequency control that
gives 1 Hz of tuning range.

I suspect the oscillator puts out 10 MHz and there is a frequency
divider on the interface board to reduce it to 1 MHz. The old HP
oscillators that actually ran at 1 MHz like in the 524 counter had
huge crystals, that were themselves nearly the size of a whole
10544 oscillator.

Anybody have a preference on sources for crystals? I'm looking for several specific values in the 17-18MHz fundamental range. I prefer plug-in crystals and sockets, if that's an issue.

Has anyone done business with http://www.kenselectronics.com ? He lists cut-to-order crystals for $8, so if his quality is good, he's probably the one I'll buy from.

FWIW, here's the complete list of frequencies that I'd find useful, though I need them in pairs (some simplex, some 1MHz offset) suited for third overtone use with a 455kHz IF.

17.34333MHz
17.35666MHz
17.36166MHz
17.50633MHz
17.51333MHz
17.52500MHz
17.53666MHz
17.54330MHz
17.63167MHz
17.64333MHz
17.71833MHz
17.72833MHz
17.75000MHz
17.82500MHz

and for 99% of the applications it doesnt matter which one you choose
from 2N706, 2N2222, PN2222, 2N2926, 2N3394, 2N3704, 2N3904, 2N4401,
MPS2926, MPS3393, MPS3394, BC107, BC108, PBC108, BC147, BC148, BC237,
BC238, BC546, BC547, BC548, ST8013 and many many more -
which we call TUN (transistor universal NPN) in Europe, opposite to
TUP which means PNP type and has almost as many equivalents

Bought 125x MPS3394 in 1970 because Motorola had the cheapest offer,
also some 2N706 from Poly-pak, later some hundreds BC547, got some
hundred ST8013 and later got 3000x BC238 from an OM - they are all TUN

My all time favorite antenna is a 100' wire fed off center (seem to remember 15%) that worked well on all bands with a home brewed tuner. Guess feed line might have radiated some by that could have been a plus. Twenty feet or so high at the feed point got it done just fine. Getting ready to put up another this week-end.

Joe,

I order all my custom values from Hy-Q.

They are an aussie company with world wide production and shipping,
quite good service. Off the shelf values are a mere 10c or so each,
customs are about $20 depending on the ppm requirements. Lots of case
styles to choose from.

http://www.hy-q.com/

http://www.hy-q.com.au/ (more info here)

I don't know how helpful this is for people outside VK land though.

I doubt that there's a higher quality supplier than International Crystal. They will make anything you want, they know about virtually every radio ever made and can find the right crystal specs in about a millisecond, and they will build the crystal for your specific circuit without any hassle. If it's a homebrew circuit, however, you will need to give them some details about the circuit. They are pretty picky about wanting to be sure your crystal oscillates on 17.34333 and not 17.34334 when you plug it in.

The downside is that they are expensive ($15-25 U.S. typically) and since they build the crystals to order, you will wait at least a couple of weeks, more if their first attempt doesn't meet your specs.

..

The 4-1000A is probably the best bang for the buck tube out there! That Screen Grid helps on 10 meters quite a bit too. They'll take serious HV (5KV is safe) on it without worry. With a glowing Red Plate, they're quite happy (NO Parasites Please!) for hours on end. In Class C service (@5 KV or so), we're talking 3 or 4 KW input. Best if grid driven with a tuned input at say 20 watts. They can be had for $100 on the net. Some guys use Furnace blowers to keep the glass from melting. Try that with a Ceramic tube. Hey, Legal Limit is plenty if you have a good antenna.

Those Microwave Transformers will NOT work.. They're made for Pulse duty and will fry quick when made to provide continuous DC. If the transformer doesn't weigh at least 20 Lbs, a KW isn't going to happen. The FCC will find you.

This is so hyped up, it almost seems like you are selling something.
If your design is so hot, and so small, put it on a webpage somewhere,
and let people visit it, and discuss it.

Do a proper bibliography, and let us know exactly what circuit you
started with. Somehow, I suspect you've got ahold of one of
Chrles Kitchin's articles. He's spent a lot of time looking at
regen and superregen articles, and updating them to match present
devices and situations. If it is derived from one of his circuits,
take note that he has tried to improve the performance of the superregen,
and those "unneeded" parts are an attempt at getting around some
of the traditional limitations of the circuit. Take that stuff out,
and you've got nothing special. If you look in the old books and
magazines, you can find a ton of superregen circuits, and virtually
all of them are as simple as you can get. One transistor, and maybe
some audio amplification. Yes, very simple to build, but with
lots of limitations. At the very least, without an RF stage between
the antenna and the superregen detector, the thing will radiate and
interfere with nearby radios and TVs.

Check out the 2001 ARRL Handbook (and probably other editions). It
has one of Charles Kitchin's superregen receivers. Two transistors,

one coil, and an LM386 AF amplifier. I can't remember if this is his latest variation, or there's been something better. Take note that he has tried to improve the selectivity; most superregens are notorious for a wide passband.

I've posted a list of his superregen articles previously, and can't be bothered checking right now. He had an article in the Fall 1994 issue of Communications Quarterly, that I've never seen but assume is an overview of the topic. The article in the Handbook was originally published in QST some years back. He had an article in QEX after that. There might have been another. He's also written a number of articles about regen receivers.

But thanks for reminding me. After I mentioned his work on a previous occasion, he sent me a pdf file of one of his later articles, and I didn't have the computer to view it. I do now, and I must take a look.

I was very happy with the price & service provided by West Xtals in
Kelowna, BC. I made a group purchase of 8 MHz xtals for some S-band
downconverters, and was quite pleased with the product.

GENERAL ELECTRIC TF4RX02NA Power Transformer

Has four seperate 32 volt @ 4 Amp windings. Connect in series for 128
Volts or +/- 64 Volts Center Tapped. Primary tapped for 109,
115,120,126, and 132 Volts. Potted in military style case with
terminals. Weight: 20 Lbs. Great for 200-300 Watt Solid State Amp.

see picture:
http://members.home.net/mnowlen1/equipment/ge-power-trans.jpg

Very Good Condition, Tested and working.

Two available.
$50 each + Shipping

Please reply via e-mail or telephone

Thanks for reading.

People have discussed this sort of conversion here before. I remember
them, but couldn't think of anything specific. While checking
for something else, I came upon a post of mine where I reposted someone's
comments. Going to dejanews/google with the subject, I got a lot of
hits, and I don't feel like sorting them out. Go to
http://groups.google.com and use "49 MHz to 6 Meters" as the keywords.

This post was the one that I saved at one point because of it's depth:

http://groups.google.com/groups?q=MC3357+49+MHz+to+6+Meters&hl
en&selm=4ngi71%24kev%40vixen.cso.uiuc.edu&rnum=1

(don't forget to paste the two lines together)

The crystal controlled ones don't seem to be a problem converting.
But when people have looked into the multi-channel ones, they've found
them to be too much trouble.

I just suddenly realized that I haven't seen the 49Mhz walkie talkies
advertised in the Radio Shack flyer in some time. I hope they aren't
going off the market, because they are cheap enough and in a good
frequency range to be useful for other things. Of course, if
the FRS drives the 49Mhz units off the market, maybe they'll show
up at garage sales?

I figure when the FRS units drop enough in price (they haven't got to that point yet), I'll buy one to see what's inside. Since they are much higher in frequency, I think they have potential to be used with a transverter for the higher bands.

If you have a choice of clipping back to fresh wire, I would do it. Any method used to solder oxidized wire will be a compromise and can degrade long-term reliability.

I remember that long ago, I read about a project in magazine "Wireless World",
about a project home brew shortwave receiver.

The project is transistor and tube mixed.
Local OSC is a 10 MHz crystal and multiplied to more then 30 MHz.
The first IF will be with in 1 to 2 Mhz. The dial for these is a MHz dial.

The second IF is a receiver from 1 to 2 Mhz, the tuning is the Khz dial.

Then the normal 465Khz if and the usual stuff.

Did any homebrewer remember the project?

Regards

K.T.Chan

<Snip>

I must say to the original poster that ALL the advise posted here
has been worthwhile, IMHO. but again, the problem I've had is that
I didn't start out smart so now, since I use the same ISP, I'm stuck
with my mistake no matter changes I might make as the old or "real"
e-mail address still floats around out there.

I do have financial advantages from sticking with this ISP, so
spam is the price I pay. (Monthly checking account debits mean
no credit card usage and only 15.00/mo. They upped to 19.00
but as a debit I fell through the cracks I guess, although I do have
a contract of sorts.-- old to a prior owner.) The price I pay is spam.

Greetings,

I run a FT-980 along with a FL2100-B amp. Although interface cables do exist (I think), I don't have them. Instead I just flip the operate/stndby switch ON/OFF as needed. Somewhere I read you could more easily just replace the jumper wire on the back with a foot pedal. Seems reasonable. Remember them saying you could get one at the Rat Shack, Now I went and got one(cat# 44-610d) but this looks like it'll burn in a second. The cable is a simple mini-plug with the typical very fine stranded wrapped around an even smaller wire "core". Obviously I would snip the miniplug and expose the wires. I think you all know what I mean. I typically run about 500W PEP. Am I gonna fry something (my foot? or worse my rig/amp) if I try and replace a 14AWG jumper with this flimsy thing? Maybe not, but would like a reply or two from the ng first before I risk it. After all, we're talking about a grand worth of shack equip. vs. a 4.00 switch. Feedback??

Thx. es 73 de KG4JBM/ Andrew

My 1978 edition of "Amateur Radio Techniques" (a compendium of material
from the Technical Topics column in the RSGB's Radio Communication)
mentions a "Deltahet" by VK2AZN in "Radio, Television and Hobbies",
though no date of the original article is given.

It's basically a Wadley-loop that showed up in the Racal receiver, and
then some transistor receivers, like the FRG-7 and the Barlow-Wadley
XC-300 (or number close to that) portable.

The scheme eliminates all those crystals you'd need in a receiver like
the R390, where the tuning covers a fixed 500KHz range, and then
there's a converter ahead of it. You need one crystal for each 500KHz
range. The Wadley Loop came along before synthesizers were common,
and by adding a conversion to the signal path, you can get away with
a tuneable oscillator and a 500KHz crystal to replace all those crystals.

The block diagram and frequency scheme is identical to the Wadley loop
as used in the Racal receiver, so instead of me explaining it again,
see a previous post of mine on the topic at:

http://groups.google.com/groups?selm=blackm00-1604001411420001%
40dialup-271.hip.cam.org&output=gplain

Well,.... not sure how to take that. If you mean I'm showing poor
"netiquette", them allow me to point out your usage of the following:
a. Initializing a sentence in lower case.
b. Use of run-on sentence (s). Separate "subject" from "if" as example.
c. Lack of a period at sentence ending.

Further, I don't consider the subject inappropriate and your Mama might've
taught you something about "glass houses" and those who live in them.
If you're a known troll then this is the best you'll get ought of me. Still
waiting for a meaningful response. Thx.

But what are these for? They can be for the conversion of a 49MHz
walkie talkie, like you asked about in another thread, because they
have 10.7Mhz first IFs.

Since they work to the upper part of 6 meters, are they for
radio control use? If they are, perhaps they are crystals you
can buy off the shelf, just like you once were able to buy CB
crystals for some rigs in pegboard packages? I have no idea
if they still make commercially made RC units for 6 meters, but
you might check a hobby shop.

I hadn't picked up on that. He said 455 Kc IF like it was single conversion. But I can't picture going from 6 meters down to 455 in one whack - it just flat wouldn't work, so clearly there is another IF or something else going on here.

That being said, I guess I change my wishy-washy recommendation of ICM. Based on your question and the (limited) data you have given, the ONLY way you are going to get crystals that work is to call International with the make and model of the radio, and the OPERATING frequency you want. I had done a back of the envelope that this was going to cost you $400 or so at ICM, but $400 for crystals that work is probably better than $200 for crystals that don't.

If you still decide to go the cheap charlie way, buy one pair and see that it doesn't work. Then re-do your calculations and buy one more pair. You can't return made to order crystals, so don't go out and get two dozen crystals until you are sure.

..

> > Icom mike? I hear most common microphones are not a good match for
> > Icoms.

> An Astatic D-104 works well on my 725. TNX DE AA8WL

I have a D-104 that I use with my Kenwood TS-830S, along with a Shure mic (plastic housing, tapered cylinder mic head about 1.5" dia at the head and 2--2.5" long head). The Shure mic gives me a nice, pleasant signal to which to listen for ragchewing and net ops, whereas the Astatic has attenuated low-end response and gives a tinny, punchy feel to the audio (much less pleasant for casual ops) which I've been told is good for pileups.

My suggestion: Find out what impeadance the rig looks for in a mic, then match the mic you want to that impeadance. Shouldn't be much more difficult than putting a transformer or other such in line.

Good luck,

Henry C. Gernhardt, III

I'd used Acid Flux (The liquid kind you buy in a bottle for Plumbers)
initially. Soak it in the stuff for a minute or so, then use a torch to burn it
off. Do that a couple times then rinse it off. Then Solder it with your
standard Rosin flux based 60/40 solder and a big Weller pistol grip solder gun.
Never a problem.. works every time for me.

Can you temporarily send some e-mails with attachment to fill
your e-mail accounts so that any other future incoming e-mails
will be rejected since your e-mail account exceeds the given
quotas. Meanwhile, open a free e-mail account from HotMail.com
and use it for about a month before you clean your over quota
e-mail account from your ISP and see if you still get a lot junk
e-mails. Since I did this, my e-mail account went back to
normal, i.e no more junky e-mails. This may or may not work for
you, though.

> my bench.

Which "little plug in card"? The "original" HP5245L had a crystal oven with a "little plug in card" next to it in the A26 slot. This card had two circuits, the osc/agc loop and a "trigger" (looks like a distribution amplifier?) Both of these circuits worked at 1 MHz. The next "little plug in card" over (in the A27 slot) was the x10 multiplier.
Since you appear to have a modified version, with an oscillator instead of a crystal oven, I'd be guessing that the A26 card was left in place, using the osc. circuit as a buffer amp. The output of the A26 osc/agc loop went to a contact on the "mode" switch. The common of the "mode" switch was connected to the "trigger" amp input on the A26 card.
I doubt that my old schematic would match your card, but the pinout info and voltages may be useful. Would these be enough help?

I have a Standard C5718DA Dual Band transciever with CMP843A microphone. The radio was manufactured by Marantz for Standard. The radio is controlled by the microphone which communicates with the main body of the radio with serial digital codes. These codes have not been published in the owner's manual.

I have tried to obtain the codes from Standard service when they were in business with no luck. I have tried the Yaesu - Vertex service after they bought out Standard. The Marantz web page is for audio equipment now.

Can anyone provide me with the codes? Or make suggestions on how to contact the manufacturer in Japan? Or any other source for this info?

How do you figure? I'm looking at the innards of my TRC-509 right
now, and the crystals here are 16.610MHz (TX) and 16.45833MHz. (RX)

Unless I'm missing something, that comes out to
TX Freq=3(TX)=49.83MHz
RX Freq=3(RX+IF)=49.83MHz

Which would make IF=455kHz. Am I missing something?

Possibly; I've been doing all the work on it when I can't sleep, so
it's not like I'm all that conscious for 90% of the time I'm looking
at it.

I'm not planning on getting all of them at once, just one pair, (I was
hoping one pair would turn out to be stock values somewhere) and then
maybe more if it works. At any rate, experimentation with 17.1MHz and
18MHz crystals and a dummy load appears to show that the TX side will
work fine all the way to the top of 6m, and I have another 6m FM
receiver here, so even if I can only get the TX side working, it'll be
well worth the $5 purchase price of the talkie and the experience
gained.

A person I once worked for repaired hi-fi systems in his youth. One customer had some very big, expensive speakers. He had put the speaker wiring in the wall, and used regular 110 volt outlets as connectors, with ordinary 110 volt plugs on the short speaker wires. I'm sure you know where this is going. After fixing the hi-fi or speaker, the repairman plugged the speaker back in. He said that the moment he heard the monstrous hum, he knew what had happened. But by the time he got it unplugged, it was too late. Let's see, 115^2/8 = 1653 watts. Loud hum, indeed.

I'm with Mike. It's a terrible idea to use a common connector for anything other that its intended purpose.

I used to do custom work for the local Parks Board and they had me fit up a
public address amplifier with ordinary 110v fittings for quick connections
to the speakers which was OK because the attendant knew what he was doing.
But somebody OK'd the use of the system for Square Dance night at one of the
tennis courts, so a local Citizens' Committee undertook to transport it and
make a temporary installation. Need I say more ? John M. VE7AFN.

I agree, it is risky to use something that is also a standard for
something else. The Hubbell plugs are widely used in industrial
settings for 120, 240, 480V at high amperages, single and 3 phase.
Imagine what could happen with 480V 30A 3 phase to a 12 VDC rig.

The Anderson Powerpoles also have the advantage of being a standard
that many other hams are now using, and there may be advantages in an
emergency to being able to interconnect with the equipment of other
hams responding.

Especially in an emergency, with unfamiliar people working together,
make everything as simple and "user-friendly" i.e. idiot-proof, as
possible.

Happy trails,

I have a piece of equipment with bulbs that look like cylindrical fuses.
They are just under 20 mm long and just under 5 mm in diameter. Both
ends are marked:
RR 12V 1W in small block letters.

I have searched the WEB and the usual catalogs with no success. Does
anyone have a clue as to the proper description or part number?
Thanks.

These are common in stereo gear. Search fuse lamps on google or ebay
and you'll find plenty of sources.

Can any of you older gentlemen with older versions of the ARRL Handbook find a brute-force 60 Hz Pi filter for use on the output of a 60 Hz inverter power supply? My need is not for amateur radio.
I want to phase synchronize 3 "modified sine wave" (recent) DC to AC inverters to give a Y-connected 3 phase 120 volt output to run a 208 volt Delta connected motor. However, the "modified sine wave" output on these inverters has a high impedance state between the positive and negative pulses that would prohibit proper phase current conduction. The capacitors and inductor in the 3 Pi networks would have to supply the current during the high impedance intervals. (I realize that isolation transformers would be required.)
(E-mail address is invalid to fool spambots)
Any info you can post back to this NG would be appreciated.

I know this is not strictly radio-related, so I apologize in advance. But I know that people that homebrew ham stuff do a lot of other stuff too.

I am building a homebrew turntable. Most of the work has already been done for me, with an assembly from American Science and Surplus. But the output is too high- I need to attenuate it.

What do I need to buy?

Thanks in advance,
DAB

Sounds really similar to the 5W bulbs commonly used in car dome
lights. They might have made something similar in 1W for the dash
instrument lighting.

What output is too high? You need to explain what you have and what you are trying to do.

I am thinking perhaps you mean that the signal from the pickup is too loud. That may be because you are using a ceramic or crystal cartridge into the magnetic input of an amplifier. If that's what you are asking, then you simply connect the audio into an AUX input, or change the cartridge for a magnetic one (they are better anyway).

Yes they used to be called festoon type lamps and are common. Check electronics supply houses. They look like 3AG fuses and are the same dimensions but are lamps usually used to illuminate radio dials.

They are available in 6V, 8V, and 12V versions. Make sure you get the right one.

It's possible that you are using the more sensitive moving coil phono input.Look for a MM (Moving Magnet input). Don't use AUX as advised because this does not have the required RIAA network to contour the cartridge signal.
A moving magnet, ceramic or crystal cartridge may well have a too high output - rather than trying to attenuate and possibly upset the impedance matching it might be worth changing the cartridge for one with less output.

Norm,

That explains a lot! The oscillator has the 10544 part number, with
a -60036 after it. It definitely puts out 1 MHz. I took the A26 card out
and began tracing it, and sure enough, there is a section that looks like a
buffer, but no multiplier. I took the A27 out, and it has 6 variable
inductors along the top, and three transistors. The multiplier?

So, two things that would really help:

A schematic / pinout of the A26 card

A schematic / pinout of the A27 card

Any info you could forward would greatly assist me. Maybe I should just
find a counter with an actual 10 MHz oscillator in it!

Cheers,

Tracy

A ceramic or crystal cartridge does NOT require RIAA equalizaion; it's built into the characteristics of the element. Well, actually it's not but it does have roughly the required response. Moving magnet and moving coil (lumped as magnetic) do require this, as well as lots more gain than ceramic or crystal.

So the appropriate input for crystal or ceramic is AUX. And for magnetic, is PHONO.

It's not your math. The 49MHz walkie talkies that I've looked at,
the TRC-504 and the TRC-501, are dual conversion. There's a third
crystal and they use one of those Motorola MC3357 IF strips that's
designed to convert 10.7MHz down to 455KHz. I've yet to see a post
about those walkie talkies where someone mentioned only a 455KHz IF.

If that's the crystal you're reading (and there's also no 10.240MHz
crystal in there too), then you must have a single conversion unit.
I wonder what the story on that is, was it a cheaper model, was it
an early model that didn't work too well, or did they decide with
time that they could get by with a cheaper design?

This is not as appealing a unit as the dual conversion ones. One
of the interesting things about the dual conversion units was that
apart from the low power, they couldn't have been particularly different
from a lot of two way equipment. A single conversion to 455Khz makes
it more like a toy.

Having looked at 49Mhz cordless phones, I had assumed they all were
dual conversion, and I keep suggesting them as a source of FM IF
strips. But one time Mark Zenier mentioned that some he'd seen
were single conversion, going straight to 455Khz. Later, I picked
one up at a garage sale that used that very scheme. If I recall,

though, it used one of those Motorola IF ICs in the range of the MC3357, but used the converter intended to go from 10.7Mhz to 455KHz as the first mixer, going from 49Mhz straight down to 455KHz.

I've always thought the receiver in these units had the most potential, because with a change of crystal you had a decent dual conversion receiver (or, use it with a converter for a higher band, or bypass the front end so you have a 10.7Mhz IF strip to be used with an external front end or some receiver that outputs that frequency). If it's not dual conversion, it's not nearly as appealing. The transmitter isn't all that special, and by the time you add an amplifier, one might as well start from the crystal up.

You could try putting the transmit crystal in the receive socket. That will get you reception in the 6meter band, though maybe not high enough for this sort of use.

1270. receiver front end noise question

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-11 19:02:01 UTC
From: hexter@blazenet.net
Message-ID: <u6g599ik30a363@corp.supernews.com>
Source record: 46412

I am trying to make a microwave receiver more sensitive, and I have
run into a noise floor problem. Here is the layout,

X-band waveguide input directly into a mixer consisting of
a 1N23E, and a 1N23ER balanced mixer setup. Local osc is divided
to drive the balanced mixer pair, and the drive is about 0dbm.

The noise figure of the diodes is stated as being 8 Db, and they
are driving about 300 ohms resistive load per each.

Question 1, For a SNR of 10 Db looking at the load resistors, what
is the minimum detectable input signal to the waveguide? Use 8 mhz
as the bandwidth of interest if that is important to the calculation.
The I.F. freq is 60 mhz.

Is it possible to get 10 Db SNR from an input signal as low
as -115 Dbm at the waveguide input flange, or is the noise floor
substantialy above that level?

Question 2. The diodes are driving a 2SC1855 transistor used as
an impedance converter and gain stage. Do you feel that this particular
transistor is to noisey for the job at hand?

I ask these questions relative to AM modulated ATV. I have about
60 Db of I.F. gain driving an ECG 1187 as my video detector/amp.

I tried adding 20 Db of I.F. gain, and it did not help the receiver
input sensitivity at all! The only thing I got was 20 Db higher noise
output.

Question 3. Would it make better sense to give up on I.F. gain, and
start working on microwave gain prior to the mixers?

Thank you kindly for any help or suggestions, 73

As we do not know what type of cartridge David has yet I was merely avoiding
further problems if he did happen to have a moving coil or moving magnet
cartridge on aux. Quite a number of upmarket moving coil cartridges have
exceedingly low ouput far less than either ceramic or Xtal but this is
splitting hairs - I would guesss we both need information regarding
cartridge type/output plus the amplification David is using.

Tracy,

I sent you an email with a picture of a 10544 and the block diagram
of the 5245. That answers your questions about the functions of A26
and A27. In my email (copied below) I describe the same physical
layout of A27, and that it is the multiplier. Why are you still
confused??

You received a reply from Rick Karlquist that also seemed surprised
that the 10544 could have a 1 MHz output. He is one of the best
informed people you could find. He designed a lot of HP's best
sources and counters. Does the 10544 look like the picture I sent?

Since it was driving the A27 card which multiplies 1 MHz to 10 Mhz,
I guess you do have a strange version that somehow outputs 1 MHz.

What is your final goal? Look at the block diagram and decide how
much you care about. Is the multiplier all you need? I'm thinking
that anything from a26 (1 MHz buffer to the divider) through the
divider chain might be easier by homebrewing with modern chips than
using the very old 5245 discrete design.

quoted email:
>>I'm sending two files. First is a picture of the 10544 which

From a company in the UK that deals in the parts. I am also sure, that if you call RF, you will get quoted in at least the $70.00 something range. A smart ham may be able to avoid paying those prices, and you may be willing to share them with someone, which is a beautiful thing, but, if you are interested in keeping a couple and marketing the others, call a couple of places (those rip off ones, lol) and see if they will take them for a nice price. There happen to be oems out there that aren't interested in "figuring out a different cheaper way"...they just want a part that is already approved that will do the job.

The diode mixer loss must be added to the IF noise figure (assuming 3 dB), so the receiver input noise figure would be 11 dB in the most optimistic case :-).

The 3dB IF noise figure corresponds to about 300K noise temperature or -174 dBm/Hz noise density. The equivalent mixer input noise density would be -166 dBm/Hz, thus with 8 MHz bandwidth, the total noise power would be -97 dBm. For a 10 dB SNR, the signal would have to be -87 dBm.

>Question 3. Would it make better sense to give up on I.F. gain, and
>start working on microwave gain prior to the mixers?

Yes definitely. The noise temperature for a horizontally looking antenna at 10 GHz is about 150 - 200 K, so a receiver noise figure of 1-2 dB is still usable. Take a look at some 10-11 GHz satellite tuner heads with plenty of gain before the mixer.

None that I can find, and it's not much are to search. I thought I might have missed one of the small-can crystals, butnothing else here even looks like a crystal. At some point, I'll try to stuff it in the scanner and put a pic on my website.

Probably all of the above; IIRC, the price before clearance was around $20, and it is a Radio Shack product.

>This is not as appealing a unit as the dual conversion ones. One

And just what are any of our radios, if not toys? ;)

>If it's not dual conversion, it's not nearly as appealing. The
>transmitter isn't all that special, and by the time you add an
>amplifier, one might as well start from the crystal up.

Ah, but half the fun will be figuring a way to get all that back into the original case, even if I have to change it to an external battery. Then I'll have a $5 toy radio that can use the local 6m repeater...assuming it even still exists; three days of scanning, and I haven't heard a peep from it. Selectivity in the receiver isn't terribly vital, as the entire 6m band here seems to be pretty dead. As long as I'm not getting channel 2 in it, it should be good enough.

Then again, channel 2 around here is pretty cool, so that might be even better than a $5 HT :)

If you want more information on the 'Deltahet' it just might be possible to get it through silicon chip magazine in Australia. Apparently they have purchased the archives of the now defunct 'Electronics Australia' (formerly called Radio, Television, and Hobbies).

1278. 100kHz to 22.5kHz conversion - will it have jitter?

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-12 00:29:18 UTC
From: la8ak.xnd@online.no
Message-ID: <3c6838d3.15421192@news.online.no>
Source record: 46420

Looking into design of DCF77.5kHz receiver.
Suppose (100/4) - (100/4)/10 = 22.5kHz,
divide 100kHz (divider chain from 10MHz) to 25kHz and mix with 2.5kHz
to give 22.5kHz. A NAND-gate seem to be a solution, but will give 2
pulses for every 10 in, so I suppose it will jitter.
another suggestion is to use analogue mixer with tuned circuits for 25
and 2.5kHz feeding the mixer

Is the ideas bad?

Need 22.5kHz to mix 77.5kHz to 100kHz, feed it through an xtal filter
and to the phase detector which is operated on the highest possible
frequency

the ALC type usually found with HF transceivers is feedback from power

amplifier to reduce gain if power amplifier is overloaded, so the transceiver operates with full gain (in such case - too much) and the feedback is actuated every time you speak too loud

Would suppose the ALC or ADC you request is another, which I would not recommend, but DJ9BV described some modifications to reduce power with transverter for his transceiver.

For my FT-7 I simply "bypassed" the 10W power amplifier, and the circuit was simplified to disable the 10W stage and take the signal from the pre-driver, which was 10mW in FT-7, believe it is 1W for FT-7B. For FT-902 and FT-101 signal is taken from PA grid circuit and PA valves are switched off (heater off)
See Kenwood TS-850 modifications for use with transverter DJ9BV DUBUS 92-2-pp30....

Much more efficient is to post such requests to rec.radio.amateur.homebrew

> I want to phase synchronize 3 "modified sine wave" (recent) DC to AC
>inverters to give a Y-connected 3 phase 120 volt output to run a 208 volt

Rick,I cannot add much on locating the 60 hz filter but I have had some experience running 3 ph motors on single phase lines..take 120 volt line ,connect three wires to the high side ,run line 1 thru a capacitor bank to motor L1,run line 2 direct to motor L2, run line 3 through a choke to motor L3 . Common ac line to center of Y connection... causes one line to lead one line to lag..that will run the motor at about any power you might need, the value of Ind and cap will determine what size motor that can be operated.. To synchronize three individual inverters to give 3 phase output at 120 degrees apart and locked together ,,, may be possible but it is over my head (away over)...good luck.. Harold W4PQW

1281. Re: receiver front end noise question

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-12 02:28:19 UTC

Source record: 46423

Given the 8 db loss of the input diode mixer stage, the sensitivity of your setup will depend upon the noise figure of the post mixer amplifying stage. Likely it should be 1 db NF or better if you are trying to get a noise figure of 10 db or better overall.

Noise from a 50 ohm resistor in nV is about 1.3*SQRT(R)*SQRT(BW), so your 50 ohm system noise in a 8 MHz bandwidth would be: 1.3*SQRT(50)*SQRT(8000000) or 2600 nV or 2.6 uV. Assuming a 10 db noise figure receiver, the 3 db S+N/N would be 10**(10/20) * 2.6 uV or 8.22 uV.

You would expect 3 db S+N/N with a 8.22 uV signal if you have a 10 db NF receiver with a receiver bandwidth of 8 MHz.

In my experience, a NAND gate mixer is only good to get the difference.
A better mixer is a XOR (7486) gate. However, digital mixing has never
worked very well for me due to the extremely high level, very high order
mixing product. Lots of birdies from high order mixing products!

Dear Bob:
The light bulbs that are the same size as a 3AG (third, automotive, glass) are 1.25 inches long. The ones I am looking for are 20 mm long and are of the same size as a (metric) 5x20mm fuse. Another list member suggested a place that has the 3AG size bulbs, and I might have to modify the bulb holder so as to be able to use 3AG size bulbs. I found one reference that suggested that either the 5x20mm fuses, or the bulbs of the same size, are "T-size."

The reference to "festoon" is a new lead. Thanks!

For what it's worth, that's roughly the same MDS I observed at the input of a 40 MHz-wide IF with NF=2 dB (two Mini-Circuits MAR-6s at 145 MHz). In my tests, at least -85 dBm at the input of the IF strip was needed for recovery of 10-Mbit/second FSK, which would correspond to about -93 dBm to -95 dBm at the antenna flange.

I don't remember the conversion-loss figure for the single-ended Schottky mixer diode in my Gunnplexers, but 8-10 dB sounds about right.

That simply seems to be the name they go by since they resemble a fuse
and the term lamp seems to be more common than bulb these days for
smaller type things that light up. Hence the name fuse lamp.
You triggered my memory that I needed some and I ordered them today.
8/$10 for a Sansui stereo receiver. I got mine from

Woulkd it be possible to run all 3 inverters off a single
frequency source? That way you could divide down some higher
driving frequency so that the inverters were exactly 120 deg
apart. Yes/no?

Cheers.

Thanks for the idea. Since I needed to swap motors (different sizes), I hadn't thought of that, but I could include the phase shift components with the motors.
Do you have a source recommendation for formulas or tables that would reveal cap and inductance sizes versus HP or amperage?

Thanks

You understand my idea exactly:

1.84320 MHz into a divide-by-640 counter yields a
2880 Hz signal. This goes to a CD4017 set up as
a divide-by-3 to yield three 960Hz signals in
phase delayed fashion.

These feed divide-by-16 counters where the 3
least significant bits are decoded as 3 counts
out of 8 to provide the pulse width for the
output pulses and the 4th least significant bit
determines whether the pulse is positive or
negative.

(Some complex phasing connections omitted.)

>LA8AK
I'm a non-amateur lurker here (I have a commercial license) so I cannot
say whether your idea is "bad".

I have an alternate suggestion if it won't offend the NG.

Connect the 100KHz to a divide-by-5 counter then a divide-by-2
counter.
(CMOS 7490 equivalent)

Gives a symmetrical 10KHz output.

Connect the 10 KHz output to one input of an XOR gate
(see note at end for alternate)
Connect the original 100KHz to the other input.

Connect the output of the XOR gate to a MOSFET with a 90KHz tank
circuit in its Drain circuit.
The tank circuit should produce a reasonably pure 90KHz sine wave.
There SHOULD be very little jitter.

Connect the tank circuit through appropriate buffering to a
symmetrical divide-by-4 counter
(2x CD4013s with notQ connected to D input?)

The output will be 22.5KHz with exactly 50% duty cycle.
You should be able to connect this to practically any mixer
circuit (through appropriate interfacing) and get stable results.

NOTE AT END:
You can connect a whole CD4011 chip to act as a single XOR gate

as follows (a CD4011 may be easier to find and you would need
a whole 14 pin chip for just one XOR gate anyway):

Connect pin 2 to pin 6 and label it Input A.

Connect pin 8 around the chip to pin 1 and label it Input B.

Connect pin 3 to pin 5 and across the chip to pin 9.

Connect pin 4 across the chip to pin 13.

Connect pin 10 to pin 12.

The result on pin 11 is "Input A XOR Input B".

(E-mail address is invalid to fool spambots)

Good luck!
Rick

When I went to Westinghouse Lamp Division product school, many years
ago, the lamp is the thing that lights up, the bulb is the glass
envelope and the luminaire is the thing the lamp mounts in. Just
being pedantic as usual.

Source record: 46441

Anyone out there have a late HP 410B with the EA-53 AC probe tube diode ? I need you to check your manual and tell me what filament voltage is specified for this tube.

The earlier 2-01C tube as listed in my manual states to adjust filament voltage for the probe tube to 5.0 V. While the HP manual states the probe can either be a 2-01C or EA-53 it doesn't specify different filament voltage settings for the two tubes. I've been told the EA-53 is a 6.3V filament tube.....

1300. Re: receiver front end noise question

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-12 17:46:12 UTC
From: jim.bolinger@lintek.aeroflex.com
Message-ID: <8d5ec8a2.0202120946.6a7231a7@posting.google.com>
Source record: 46442

Others have done a good job of answering your question.

There are a few other things that should be pointed out, however.

The noise figure of a receiver is typcially dominated by the first
active stage. If the first stage has a low gain, however, the
following stages become significant.

Any loss ahead of the first stage directly adds to the noise figure of
the receiver, dB for dB. Diode mixers usually have about 6 dB loss
(on HF, more at higher frequencies).

Unless you have a relatively sharp filter ahead of the mixer you may
find that the noise floor is 3 dB higher than expected. This is
because the mixer will be picking up noise from both sidebands.
Because the signal is only in 1 sideband the SNR will also be 3 dB
worse than expected. Your IF frequency should be such that the
unwanted sideband is far enough away for effective filtering.

> inductors along the top, and three transistors. The multiplier?

Yes, in three sections: x2, x5 and amplifier.

> So, two things that would really help:
>
> A schematic / pinout of the A26 card

P1-1,3,6,7,13 (0V)
P1-5 (osc/agc output)
P1-10 ("trigger" amplifier input)
P1-6 (-15V)
P1-15 (20V)
P1-14 (1MHz out to A27 card) approx 0.5Vp-p
P1-9 (1MHz out to A35 card) approx 1.5Vp-p
P1-11 (1MHz out to A28 card) approx 2Vp-p, capacitor coupled output
P1-12 (1MHz out to A5 card) approx 2Vp-p

I'll assume you don't need the pinouts for the P2 connector.
Note: connect P1-5 to P1-10.

> A schematic / pinout of the A27 card

P1-14 (1MHz input)
P1-2 (10MHz output)
P1-15 (-15V)
P1-5,6 (0V)

> Any info you could forward would greatly assist me. Maybe I should just
> find a counter with an actual 10 MHz oscillator in it!

No need to tear apart a perfectly good counter just for a time base. There
should be other options available.
Sorry, I can't supply schematics except via snail mail, but it looks as if
another poster has sent them to you already.

Well, since tuned circuit for 25kHz, and especially for 2.5kHz, might
be a bit awkward (though you could use active filters...), how about
using your existing 10MHz and presumably you have 1MHz, and mix them.
Select the 9MHz difference, and divide that (by 400--very easy to do)
to get the 22.5kHz. You could also do it with a PLL running the phase
detector at 2.5kHz, I suppose (or higher, and divide down to 22.5kHz).
Lots of possible ways, but as you note, you'd like a 22.5kHz that is
clean (except for harmonics).
Cheers,
Tom

I have what I believe to be a Hygain Ham Rotor. Everyone tells me it is but I don't know for sure. I can send pics if you like. I'm interested in either a light duty rotor and controller, 2 meter or 6 meter equipment or just about anything related to ham radio.Email for pic or to make an offer. crandall@ee.net

thanks
Rob

Well, you are right, or course. I got the picture of the oscillator and the file containing the x10 multiplier. It is much different than the multiplier A27 board from this counter, but I can use it to build one if necessary.

My real goal is to get a really good 10 MHz standard for my workshop. It sounds like it would be a lot easier to get an old HP5245M with the hi stability oscillator and just use it.

BTW, the oscillator I have looks just like the one in the picture, except the p/n is 10544-60036.

Thanks everybody for the help!!!

Tracy

I am working on a homebrewed 1/4 wavelenth HT antenna with an SMA connector.

I tried using silicone to hold the copper wire into the SMA connector (to hold the wire in place so that it wouldn't fall out). It didn't work. (I should save the silicone for repairing minor headlight damage, which is what I bought it for in the first place.)

So what kind of epoxy or adhesive should I use instead? I think I need something that lacks viscosity at first, becomes very hard when solidified, and doesn't allow air pockets to form inside.

this is certainly a very much better idea, but still I can't see that
it doesn't jitter.
Draw the time sequence diagram for CD4017 (signal from carry) with
CD4070 and second divider CD4013, but the resulting waveform (without
tuned circuit) varies in content, so I suspect that it will create
jitter which is very critical for an offf-air reference oscillator to
calibrate microwave equipment, even if it looks fine and symmetrical
when the 90kHz BPF is connected..

Also considered to use CD4526 (have hundreds of this device, too), but
can't see it has any advantage over CD4017 for the purpose

Supposed to take the output from CD4070 via a resistor to a capacitive tap on a tuned circuit and at the same time go to an inverter (1/4 CD4070) as a quasi-linear stage. Have some surplus 4.5mH coils with Q=650, a suggestion is to use a capacitive divider of 12+15nF capacitors, but have not calculated the loaded Q-value for this circuit

but I think you must make a long search to find somebody who could
build the required 40Mc/s bandpass filter, and I suspect such filter
is not satisfactory for modern day receivers. Remember the Heathkit
SB-300 has some bad bandpassfilters - even for 9MHz, and too simple
filters were a general problem for many old amateur radio rigs

Discovered that ECC84/6CW7 is an interesting valve for cascode
amplifiers (see G2DAF receivers), it will run with 6mA current on only
50-60v per system (have not calculated the conductance), seems to be
the only possible valve for receivers with low supply voltage as used
for Drake 2-B, 4-C, SB-300, 51-S etc, but for one reason or another it
was obsolete since 1958

see http://frank.nostalgiaair.org/sheetsE.html or
http://frank.nostalgiaair.org/sheets6.html for valve data and
characteristics

I would think 5 minute Epoxy would work fine.. be sure you solder the
wire to the pin first though.

Actually, I think it's www.digikey.com, no hyphen.

Digikey's prices aren't bad, and their service is stellar, but often it helps to look around. Oh yeah, and unless you are in Outer Mongolia, make sure to specify UPS ground. Their default shipping is 2nd day air which can get expensive. At least where I am, it's over 5 times the price and no faster.

For example, plain old 1/4 watt carbon film resistors from DigiKey are 5.6 cents each if you buy 5, just under 2 cents if you buy 200. However, www.radioshack.com sells them for 7 cents each for less than 10, but a penny a piece if you buy 100. 100 may sound like a lot, but it's only a buck, and for common values this doesn't take long to become a good deal. It always pays to put 10 or 100 into radioshack's quantity box to see what happens - sometimes there are surprises. They do have the worst search engine on the planet so unless you have the RADIO SHACK part number, you need to browse.

RF specific parts are a little harder. DigiKey has almost nothing, radioshack.com has some, but often they are expensive. Dan's Small Parts has a lot of RF stuff at good prices, but he only takes orders by snail mail so it's at least a couple of weeks. http://kitsandparts.com has a very limited selection of some hard to find parts, but his prices are very good.

If you need something hard, like an RF power transistor or an air variable cap, www.rfparts.com has probably the best selection, but they are definitely the high priced spread.

I like to get stuff from B.G. Micro a lot. You need to watch it, but often they have extremely good prices. Their selection is a little eclectic, however, and their prices aren't always good, so you need to look around. For connectors, especially non-RF, and odd mechanical parts, Mendelhson's often has a good deal, but again, an odd selection.

At the end of the day, you got to do a lot of shopping, and it's complicated by the shipping which usually favors larger orders. (Not always, radio shack is expensive for large orders!) On the other hand, it sure is a lot easier than it was 20 years ago.

..

Hi Tom!

one of the only solutions I can see to avoid jitter is to use a x9
multiplier - with simple 9MHz xtal filter and divide down to 22.5kHz,
but it is a waste to use this divider from 9MHz down to 22.5kHz.

Another suggestion is to use 50kHz signal with a x9 multiplier to
450kHz - easy to find 455kHz LC-type IF-filters.
100kHz leakage may be a problem(?)

Have you a good suggestion for a harmonic generator?

I am an amateur machinist and was wondering the same thing. I would
like to build my own set of paddles for a keyer.

Anyone have any detailed pictures/drawings to give me an idea? I have
a
small CNC mill and CNC lathe. If someone had the drawings (or could
point
me at good pictures to derive (alright copy) a good design, I would
offer
to machine some of the parts for them.

I was thinking of using wieghted black lexan for the base and paddles.
Brass and stainless for the rest. I downloaded the K8+ keyer code for
the PIC
16F84 and it works fine, so I guess the electronics are good for now.

30 years ago when I was a novice, I had limited funds and still had to
have
the best gear the store would sell. Now I have unlimited funds and
would like
to scratch build everything. I have my VFO and DSP done. I am
working on a
receiver/transmitter combo and would like to front-end it with my own
keyer.

thanks.

There are paste form two part epoxies -- used in marine applications -- some of them will dry under water! I have had pretty good success with forming parts with them. I have also used them to make good screw mounts in materials like wood where you can tap the polyester resin to a much higher degree of precision than wood.

In my R2, I don't find a need for a preamp on 20 meters, since I hear more noise with the antenna hooked up than unhooked. I have tried an MAR-6 preamp, but it is a lot of gain, as others have said - it did bring signals out of the noise on a very quiet band, but for sure would collapse with a busy band. Interestingly, Rick uses the MAR-6 as a preamp for entry-level VHF work in his "Little Mother Board" available from Kanga, but that would be just that - entry-level, simple to build, performing "OK" as a starter.

I have a FT757GX that will drift up and down a khz or so after
it has been on for some time. Some times it takes quite a while
(more than an hour) to drift, if at all. I suspect that since it is such a
compact radio the VCO is getting warm. I have a RF VTVM
and freq counter. Before going in a trying an alignment, is there
anything I should know or be wary of? I have the Tech supplement
that gives an aligment procedure. Just trying to be cautious. Looks
like just taking it apart might be a chore.

I have seen (don't ask where) a divide by three circuit
much simpler than that, used in a CW keyer to get the dot/dash
ratio correct.

Locate that circuit and a simple 555 timer would give you enough
exactness (probably) to keep the line frequency.

Good luck.

Ooops.
I didn't intend for the tuned circuit to be a BPF. Let me suggest a
replacement circuit for the MOSFET and see if my idea is
clearer.

Connect the output of the XOR through a resistive divider to the
base of transistor #1 of a long-tailed pair.
Connect the base of transistor #2 to a bypassed resistive divider
or to a zener and bias resistor.
Experiment with a value for the common emitter resistor.
Connect your 4.5Mh coil tank circuit in the collector of transistor #2.

Now transistor #1 of the long-tailed pair is effectively switching
a high impedance current source (transistor #2) into a Hi-Q
free-wheeling tank circuit. The Q of the tank circuit will determine
the distortion and stability of the 90Khz waveform. With very
light loading, the 90Khz tank would act as a damped sine
wave source. The switched current source serves only to jog
the tank circuit at a 90Khz rate to prevent the waveform from
decaying.

The capacitive tap could be used to reduce the load on the tank circuit presented by the following circuit (your inverter?).

Should replys to a post be placed at the beginning or end of the original post?

I am restricted to using Google for accessing news, and Google only displays the beginning of a long post, unless you 'click here to read the rest'.

I find it easier to read a reply if it is placed at the beginning. Embedded comments are hard to follow particularly if they go beyond Googles line limit.

>
> - Dan Tayloe, N7VE; Phoenix, Az, Az ScQRPions

Dan, this is slightly off-topic, but have you ever tried using a 'D'
flop as a mixer? The higher frequency goes to the 'D' input, and the
lower frequency to the CLK input. The difference appears at the 'Q'
output. Since the 'Q' output is clocked to the phase of the two input
frequencies, it should have low spurious mixing products.

The mixer would not help in this case - the OP needs to generate
22.5KHz and has 25KHz available. But it could be useful if he had
22.5KHz or 27.5KHz signal and needed to generate the difference of
2.5KHz.

Any thoughts?

<snip>

Computer programs can only do so much. Improving your knowledge of
antenna theory and practice will give you an edge in that you'll know not
only how to -really- use whatever software tools you end up with (most
assume a certain level of knowledge of electromagnetic theory and basic
physics), but you'll also have a better change to catch any errors they
may produce as a result of bad input.

The ARRL's 'Antenna Book' contains a wealth of information. Note
that a scientific or graphing calculator would likely be helpful in
dealing with some of the number crunching.

Source record: 46372

Almost everyone, it seems, has a PC, particularly if you are already into electronics.

Every PC has a sound card.

A lot of neat stuff is being done with them these days, but most of what I see only uses one channel.

A lot more neat stuff could be done if both channels (left and right) were used.

My question is, are the left and right channels sampled simultaneously, thereby maintaining their phase relationship? A phase difference would still be usable, so long as it is constant, for what I have in mind.

This would be easy to test with a simple experiment. Hook up an audio signal to both left and right channels. Record it. Play it back and look at the left and right outputs with an oscilloscope. They should be identical in both amplitude and phase, assuming all the soundcard controls are set properly.

Perhaps I will try this when I get a chance

Has anyone already done this, or already know the answer to the question?

Jim

Hi Jan-Martin,

OK, one nice thing you can do is multiply by 3, and do it twice. An advantage of that is you can go from 50kHz to 150kHz with a balanced circuit which has very low 100kHz and 200kHz (and all even harmonics) output, and that makes it easier to filter; then multiply that up to 450, with the second times 3. Of course, your 50kHz square wave is already rich in odd harmonics, and you can even just pass that through a pretty good 450kHz filter and probably get a decent result. You could also mix 500kHz and 50kHz to get the 450 (and 550). If you did that, you wouldn't have to worry so much about the 350kHz and other signals, perhaps, and you could put a "zero" on the 550kHz, to really knock it down. I don't know what the ultimate attenuation of the little ceramic filters is, but if you only have one other major signal (like 550kHz) to kill, then a notch to remove it should do the trick.

If you go to http://www.wenzel.com/, you should be able to find some interesting ideas for simple multiplier and divider circuits.

Hope this helps...sounds like there are lots of possible ways to do the job, but what works best for you will probably depend on what you have around to work with. I'd probably go for more digital division, if it made the mixing or multiplying easier, just because it's easy (for me) to put lots of division into a CPLD. But I've also put most of a PLL into a CPLD, and doing it that way would have some appeal too...maybe a 9MHz VCXO, phase locked to the 10MHz ref, and then divided down. I think it would all fit into one 74AC04 and a CPLD, supported by a crystal, a loop filter (maybe with an op amp), and a very few other passive parts. If it didn't have to be locked to the 10MHz ref, that makes it even easier, of course, but I gather that's part of the requirement.

Cheers,
Tom

Dunno, the Anderson connectors have been around a long time, and also are very standardized. Myself, I wouldn't use anything but anderson connectors. I haven't seen the radio shack versions, but I'm almost sure they have to be micky mouse compared to the anderson connector. I've been using the andersons for about 15 years, and have never had one break yet, and have never had one be a point of excess resistance in the line. Thats important to me because I run 20 amp hf rigs. They have siver plated contacts, ands they are flat and wide. They also lock real tight and can only go the right way. You'll never fry a rig going backwards. And any connector will plug to any other, being there is no male/female pairs to deal with. I'm still using the first one I ever used, although it is starting to crack slightly on the plastic flanges. It's probably been plugged/unplugged about 926 times and 15 years of camping abuse. Still works fine. For a ham radio, they are so overkill, you never have problems. I use the one piece gray versions rated 600v at 50 amps. The last batch I bought I got at "on-line electronics.inc" at (714)847-5111. The part # was 6319. I've also seen them at graingers. Their website is http://www.andersonpower.com/ . I normally don't push commercial products, but I swear by these things. Every piece of gear I have that runs off 12v of any current uses them. I can even jump start my car thru them when I have my 2nd deep cycle behind me, and don't even have to get out of the car. I unhook the hf rig, and plug the 2nd battery onto the power line to the battery. Try jumping your car on a radio shack connector. I bet it gets warm. :(

Hi Jim,

If you record both channels simultaneously, and then play them back, the phase will be correct. I would guess that if only one ADC/DAC were used, the interleaving would be identical and cancell the phase error. A better test would be to record with both channels and look at the digital samples, then any difference would be more obvious.

I have experimented with using two sound cards so I could input and output at the same (real) time. New cards allow this but my old sound card didn't. It also allows outputting at a different rate.

If you are using this with a radio (as the NG might suggest), your biggest problem is keeping EMC out of the radio. With my old PC, I just couldn't keep it out, I'll be trying a new case sometime soon. The biggest offender does appear to be the monitor though - but I just switch it off when it isn't needed.

James.

I use the small Anderson connectors and have had quite a few break, with
only very occasional use. But the broken plastic shell is easily
replaced, and they usually break in such a way that they're still
usable. If I needed real reliability and wasn't concerned about
interhangeability with other people's equipment, I'd use bigger ones
just for the thicker plastic. But the small ones have been adopted as
the standard in this area.

Chalk-up another acceptance for eQSL's......

Confirmation was received today from the president-elect of the
3905 Century Club that their awards program will accept hard copies
of eQSL's as confirmation. The hard copy can be printed by the
recipient on his home computer if desired, or you can use eQSL's service
to have them printed and mailed to you.

Either is OK for Century Club awards.

1339. wideband transformer design rule

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-14 04:51:55 UTC
From: Chuck Hutton <chutton1@qwest.net>
Message-ID: <k7Ja8.379$TL.315912@news.uswest.net>
Source record: 46382

I've looked through the books I have and don't see any explanation of the old rule of thumb that the inductive reactance of a balun or wideband transformer should be at least 4 times the antenna impedance.

I've tried to come up with a reason to explain the rule but it's not coming. Anybody have some info?

Chuck

It depends on what you mean by "really good". The 10544 was
superceded by the 10811 nearly 25 years ago. The 10811 is
a much better design than the 10544. In the meantime, the rest
of the oscillator industry has caught up or surpassed even the
10811. Agilent recognized this last year and closed their crystal
fab. Considering that there are boatloads of 10811's floating around,
I sure wouldn't put a lot of effort into getting a 10544 going. OTOH,
since the two are form, fit, and function interchangeable, if you
have a 10544 socket, you can always plug in a 10811 if you
come into possession of one.

Rick,
His 10544 seems to have a 1 MHz output. Do you have any idea how
this could be? I sent him a picture of a 10544 and he says it looks
like what he has.

I'm not sure, but I think the "break apart" black/red versions may be
less brittle as far as the plastic. A friend of mine got those instead
of the SB-50's I use, and it seems they may have been a bit softer
plastic. But I'd have to double check on that. I prefer the one piece
because it keeps my cables neater without two ends flopping around.
Yep, the ones I use are the "puny" anderson connectors. I'm sure the
bigger ones are stronger being they are bigger. But breakage hasn't
really been a problem here so far. It took over ten years for my first
one to start to crack on the flanges. I just wrapped tape around it to
keep it from breaking totally...I've got a couple of spare new plastic
shells when it finally breaks. MK

1343. Re: wideband transformer design rule

Newsgroup: rec.radio.amateur.homebrew

Source record: 46384

In the case of a broadband transformer, connecting a winding across two conductors puts an impedance across the two conductors. This impedance is equal to the winding impedance. The lower this impedance is, the more it disturbs the circuit it's put across. So it's desirable to have a high winding impedance. The level you can tolerate depends entirely on the circuit you're putting it across -- a factor of four, five, or ten is sometimes used as a rule of thumb, as an amount that causes an acceptably small amount of disturbance for most purposes.

In the case of a 1:1 current balun, the winding impedance determines how effectively the common mode current is choked. The winding impedance is in series with the path taken by the common mode current you're trying to reduce, so the higher the winding impedance, the more effective the balun.

There's no reason that the inductive reactance has to be high. Unless you're running enough power to cause objectionable heating, it's usually necessary only to get the magnitude of the impedance adequately high. The widest band transformers have a winding impedance that's essentially resistive over most of the operation range, and have a relatively small amount of series reactance. Likewise, the broadest band baluns have a resistive winding impedance.

It usually doesn't hurt to make a resistive winding impedance higher than necessary, although the effort is wasted. If the winding impedance is primarily inductive, though, a higher impedance can sometimes lead to resonances too close to the operating frequency, or for example at VHF when using the transformer at HF. So it's not good practice to make the impedance a whole lot higher than necessary.

Roy Lewallen, W7EL

Hope this isn't a silly question!

Is there a good starting point for programming soundblaster cards - i.e. how do you sample an incoming signal? memory addresses? control registers, etc. I've been using a AD Ez-kit Lite for which I've found much more information but at higher cost and lower portability.

Why not use thie bigger ones for yourself, and make a couple of
adapters for the smaller ones?

IMO, what we need to find is a standard that will allow both simple
connection and disconnection, and easily discerning the source
capability/draw requirements, while still allowing a high current
source to power a low current item, but not allow connection of a low
current source to a high current item.

The only thing I could see working at this point would be to set it up
with multiple PowerPole units; for example, the regular pair for a
draw (or source) of 5A or less, for a draw of 5-15A, three shells,
with only the outer two live, (maybe with a different color for the
'dead' shells, to make it more obvious) and for higher draw, four
shells, again with only the outer two active. Sources would be
similar; a 5A source bets two shells, a 5-15A source gets three, with
one ground and two hot, (allowing the 5A load to be connected to it as
well as the 5-15A) and a >15A source gets four shells, with one ground
and three hot, so that all of the loads can plug into it.

The above would make it impossible to plug your 12A three-shell mobile
rig into your 5A, two-shell lighter plug adapter, (well, it would plug
in, but not complete the circuit) while allowing you to run your 250mA
two-shell HT off the mobile's four-shell source wiring. That's as
foolproof as I can think of, though I don't doubt for a second that
there are plenty of fools just waiting to screw it up.

It is merely a question of the low-frequency response of ANY transformer.

At the frequency where winding reactance equals load resistance the response
is 3dB down on mid-frequencies.

Down to frequencies where reactance is 4 times load resistance the response
for most practical purposes can be considered flat. The magnetising current
is only 1/4 of current into the load and the frequency response is only
about 0.1 or 0.2 dB down on mid-frequencies.

Actual LF response depends on generator impedance and is easily calculated.
But why bother ? The thumb rule is usually good enough.

Hello All
I have a Hammond class a power transformer.
It's spec's are:
115V AC in
18V AC out
270VA

How many amps can this xformer provide?
Thanks in advance
Regards
Frank

I get paid here for doing fun things with computers, A/D converters,
and signal generators. Most homebrewers couldn't afford the $1M price
tag on the stuff we build, though. Besides, the lowest we go is 30
MHz.

However, there are DDS chips, minicircuit devices, and PCs with sound
cards---all very cheap. Think of the possibilities.

Frank you have a 15 amp transformer,would make a nice 13V power supply..270VA divided by 18V = 15A..Good luck Harold W4PQW

1353. Re: Power Transformer current rating?

Approximately 15 amps. 270 VA equates to 270 watts. P = I * E so I = P/E or 270/18.

Is he measuring the 1 MHz out directly at the oscillator pin? Or
after the signal has passed through to the output connector?
Regarding photos of a 10544: the 10544 and 10811 look identical.
I believe there may have been predessors to the 10544 that also
had the same packaging. I have only been with HP/Agilent since
1979, when the 10544 was just going out of production. I think
the 5245 was discontinued in the early 1980's. I remember they
had a big celebration (?) about it.

In any event, if his oscillator is truly 1MHz, I wouldn't expect
much in the way of performance from it, whatever its model
number is. Again, considering that something like 1/4 million
10811's have been made, it should be easy enough to get one of
those.

This is entirely operating system dependent.
Depending on this OS, this is either ridiculously
easy, or somewhat difficult.

The setup used by Linux is one of the simpler ones
out there: the sound card is /dev/dsp (if you
only have one), and you read and write to it like
any other stream device.

If you don't mind modifying your transmitter, you can add a simple circuit
(pin diodes and fet) to the plate circuit of the output tube(s) that will
pick off a signal for your receiver. (Here I am assuming tubes - real
radios have tubes, right? :-)) Simple and works well. I also built
the tube-type T/R switch, but haven't used it in a long time.

You need a preamp with most mikes when used on most icoms. Any mike
can be made to run on an icom. It's not the impedance which is a
problem, it's the mike drive level. Icoms build their preamps into the
mikes. Others like kenwood build the mike preamp inside the radio. I
use an audio technica dymamic mike on my icoms. I use a preamp which
is pretty much a copy of icoms preamp they use in their desk mikes.
Heil sells these preamps for using their gold line mikes with icoms. I
just built my own. I've had to use one for years, starting with a
ic-730 and now on a 706. When I switch to my 830, I just run the
element straight to that radio. It needs no outboard preamp. MK

1363. email from ARRL - president - eqsl's and DXCC !

Hello interested Hams...

I have had some interesting, courteous, and informative emails with the ARRL president Jim Haynie, W5JBP concerning the recent flap about eQSL acceptance for DXCC.

Jim was also nice enough to forward to me in-house ARRL email from Bill Moore to Jim which goes a long way to further explain the likelihood of eqSL cards being accepted for DXCC as eQSL web site now states. Jim has asked me not to include the actual verbatim email from Bill..but has encouraged me to post "just the facts as Bill has laid them out" (Jim's words to me) .... and so to the best of my abilities I'll do that now....if you want to skip ahead I can tell you it still looks like eQSL cards can be and will be accepted by the ARRL as long as some important steps are taken....

Here are cut and paste excerpts from Bill's email to Jim....
---
1. It seems people have not read the entire message, especially the part that says "acting as QSL manager". On his site I see where he has OK for sending e-QSLs, not paper QSLs.In order for us to accept anything from him we would need a letter from each station he "manages" authorizing this

2. Then, we'd need something better than his word that he is verifying logs each time a request comes in (something we do not think he will be willing to do with all the stations he has logs for).

3. The requesting station must send information listing the specific QSL information then the manager must check the log for it. I believe the term for not doing this is pre-emptive QSLing.

4. As I have mentioned to all who have written, that ARRL has not changed its policy in any way regarding electronic QSLs.

---
end of cut and paste.....

>just built my own. I've had to use one for years, starting with a
>ic-730 and now on a 706.

I change the microphones on all my Japanese rigs for Heil ceramic
elements because they suit my voice much better. These are a wire-in
replacement for the Yaesu and Kenwood dynamic elements.

Some Icom users have done the same (with a blocking capacitor to remove
the DC voltage) but it needs a loud voice to "talk it up" and make the
compression work. The same would be true of dynamic mic elements.

At present the alternatives seem to be:

* Continue shouting

* Use the Heil headphone/boom mic for the IC-706, which has a new
electret element that gives better speech quality - but that is not
available separately (as far as I know)

* Use one of the other Heil microphone-preamp combinations

* Build your own preamp.

I built my own, same as Mark, but based on a very simple circuit by
N4TMI in QST for June 2000. The preamp is powered from the existing Icom

supply for the electret, and there are only 7 components in total.

Details are in RadCom for October 2001, and PCB layouts are on my web site at www.ifwtech.com/g3sek/in-prac The web page is intended as a follow-up to the RadCom article which included the schematic.

I will try to get an electronic copy of the schematic for the web page, but for now you can easily figure it out from the PCB layout, which also includes the component values.

The first version was haywired inside the Icom microphone case. Then there's a conventional PCB version 0.75in x 0.8in, and an SMD version only 0.35in square. They all work fine.

To all,

I have recently acquired thousands of new 3.5mm mono and stereo adapters.
These are Audio Accessories model PA103, and are available for .25 cents
each, or $2.00 for a box of 10.

Great for using stereo headphones with most mono scanners.

Check out http://www.qsl.net/w8mmq/adapters.html for additional information.

Source record: 46310

The reason for the low gain is the relatively high output impedance (= 1/gm) of a source follower. An N-channel FET and PNP transistor can be connected together in what's sometimes called a "bootstrap" follower to give you the high input Z of a source follower and the low output Z of an emitter follower. Stability can sometimes be a problem with this circuit, however. You can, of course, just add an emitter follower at the output of a source follower. Either of these only takes a couple of extra parts.

Greetings, and thanks for reading this. I just acquired a Heathkit IT-11. It won't balance with high capacitor values and the powerfactor control seems to do nothing. I have no schematic for this, but I do have a manual for an IT-22. The controls, measurement ranges, etc. seem to be the same on these two instruments. Can you tell me what the differences are between the two?
Thanks

Source record: 46317

For Sale:
2KVA power transformer with 6200 VCT secondary. The primary is tapped at 105, 110, 115 and 125 VAC so this would be ideal for those without 220 in the shack as it can compensate for voltage drop in your wiring. This is an oldie but goodie. I have used it for years without any problems. I'm selling it because I need higher voltage. The only drawback with this transformer is that it is very heavy (the price you pay for CCS duty). I would estimate it at about 80 pounds. I will not ship. If you can get to the western Philadelphia suburbs you can see it in operation and I will help you get it in your car. $75 and a great price for a continuous duty transformer. Should give you about 3000 volts under load.

Email me with questions.

Has anybody got any info about the KVG S-69-4A crystal
filter? I have a few of these and also a couple of
Salford Electrical 69-4 A filters, which seem to be
equivalent the the KVG filters. I'm planning to
use one in the receive section of a 6M repeater.

Are there any accepted standards for 6M FM? How
much deviation is normally used on 6M FM? I have
built FM rigs for 2M FM but not for 6M FM.

Many Thanks.

73, Ed. EI9GQ.

Six meter standards are the same as 2 meters. Use 5 khz or slightly
less for the deviation. Many use a subaudio tone as there is lots of
skip on 6 meters. You will have to check the band plan for the
seperation of tx/rx.

But be careful about that. 15A RMS out of the secondary into, say, a bridge rectifier and a big capacitor will result in somewhat less DC current out. Huh?? Well, the average current magnitude in the secondary must be the same as the DC output, assuming no DC loss path in the supply, but because you draw the current in pulses at the peak of the line voltage, the RMS current is distinctly higher than the average magnitude. A choke input filter can actually provide more output _power_ from a given transformer than a capacitor input filter, even though it's at a lower voltage, because it significantly lowers the RMS current. But chokes are big and heavy and expensive, so people don't use them much. In this case, if you happen to want a "12V" supply, a choke input filter would be quite appropriate, since your 18V secondary into a bridge and capacitor will probably result in 25V out, and a choke input filter would give you more like 15V out. (I happen to have some high-current 5 millihenry chokes that would be great for this...and would probably _give_ you one if you wanted one, if you were near Seattle.)

Hope that's not too much second-guessing of what you really want...and I hope it's useful to you.

Cheers,
Tom

If you start at the top of a thread, and read through it in chronological order, you already know what everyone has said. In this case, it makes sense to put a reply at the top, and there is little need to resend all the original text.

If you are replying to a specific comment, then the comment should be snipped out and your answer put just below it.

Dumb question #434779: What percentage of internet traffic is made up of replies to replies to replies... without snipping out all the redundant stuff?

Yes, I used it for an active antenna for LW to 80m 30 years ago, used
MPF102 with 3mA current and a PNP device with 20mA (2N4036?), worked
fine, but it seems too complicated for many, hi. Only problem was
intermodulation with strong local mW-bc station

Another problem with such circuit is that it is difficult to avoid 3dB
reduction in gain from 10 to 30MHz.
It was another solution recently shown in Radcom for 136kHz receiver
with P8002 or CP643 with drain and source connected to a transformer
through separate links, but I am not certain how good it is for HF.
Just waiting for the circuit diagram from LA7MI who made an active
antennna with good properties....(he had to cure some problems with
local VHF FM transmitter using an LPF)

Looking for a description of the CI-IV standard by Icom.
It is used in the IC-751A and some other Icom rigs.
Guess it should be possible to have a small PIC uController to
make a parallell/serial converter, similar to the Icom UX14 option
which is no longer available.
/sm6pxj

I've built a combination CI-V & Sound card interface (for SSTV, PSK, etc)
that works quite nicely without any IC's at all. I've been thinking about
selling them, but I'm not done testing it.

You want to go from a parallel port to CI-V? Seems like an odd thing to do.
Most of the software out there expects the radio on a serial port.

The CI-V interface is normal serial except that the levels are open
collector instead of RS-232, so there isn't a lot about the protocol you
need to know. And the protocol itself is pretty well documented. In fact,
just last week I got CI-V output working from a digital dial for a radio I
am building, so that I can use my logger without manually entering the
frequency. Pretty straightforward, actually.

Give this link a try: http://www.plicht.de/ekki/civ/

The CI-V is serial data. All you need is a level converter in order to interface it to RS-232. There are a number of circuits available on the Internet.

> > bridge rectifier and a big capacitor will result in somewhat less DC
> > current out. Huh??
...etc

I'm not sure where you might find a good discussion of this effect.
The following is a very concise explanation...I hope it's not too
concise to be understandable.

The rating of a transformer, ultimately, is based on how hot it gets.
The insulation is destroyed if it gets too hot. Much of the heating
is caused by I^2*R resistive heating in the windings, and of course,
the power dissipated depends then on the RMS current value. In fact,
if you hooked the secondary to a good (AC-rated) capacitor, you could
get as much transformer heating as if you were driving a resistive
load, even though the capacitor dissipates practically nothing
compared with the resistive load. So then, consider the RMS current
versus average current...if you have 1A continuous, unvarying, then
that's 1A RMS also. If you have a sinewave of current with 1.41 amps
peak, then the RMS value is 1.00 amps, but the average magnitude is
only 0.90 amps (for the mathematically inclined,
sqrt(2)*integral(sin(theta))d(theta)[from 0 to pi] / pi =
2*sqrt(2)/pi). But if you draw a square pulse of current that's 3.16
amps for 1/10 of a cycle and zero the rest of the time, that's still
1.00 amps RMS (3.16^2 * 1/10), but the average current is only 0.316
amp (3.16 * 1/10).

So with a choke-input filter, if the choke's big enough, the current
is fairly close to constant, and the RMS current is only a little more
than the average (DC) current. But with a capacitor input filter, if
the capacitor is large enough that it doesn't discharge much bewteen
charging pulses, the pulses are relatively narrow, and the RMS current
is rather higher than the average current. (A half-wave rectifier +
capacitor is a really bad load for a transformer because the pulses
are narrower than for the full wave case AND the rectifier puts a DC
current through the transformer winding, which tends to cause core

saturation.)

For a graphic demonstration of this, connect up a capacitive input filter with a large cap. Let's say it's something like 15V output. Put a 1-ohm half-watt resistor in series from the capacitor to a 22-ohm 20 watt load resistor, so the net load current is 15V/23 ohms = 0.65A. Then the half-watt resistor will dissipate about .42 watts. Note how hot it gets. Now move the 1-ohm resistor over between the rectifier and the capacitor, and connect the 22-ohm load directly across the cap. Observe the half-watt resistor. It will get considerably hotter than it did before...perhaps to the point of destroying itself, since it will almost certainly be dissipating more than half a watt. But the load current in the 22-ohm resistor will actually be a bit less in the second case than it was in the first case. -- If you were to do the same thing with a good choke-input filter, you'd find the 1-ohm resistor dissipating only very slightly more in the second case.

Cheers,
Tom

I checked them out and they seem to carry the same "fuse lamps" that
everyone else carries. The bulbs I've been looking for resemble these
except that they have pointed ends, rather than flat. I believe the
correct name for this bulb is "festoon." These festoon lamps were used
in Fisher and Dynaco sets from the 60s.

Does anyone know if this older style are still available anywhere?

1394. QRP kits/homebrews

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-16 08:01:14 UTC
From: Checkered Demon <oh_beer_thirty@hotmail.com>
Message-ID: <elob8.307$mG7.170685731@newssvr21.news.prodigy.com>
Source record: 46339

I am planning on passing my General test in a couple of weeks. Started dreaming of QRP transceivers for trips to the mountains. I have lots of questions. The size of the rig is not important. It should be on the higher end in the power department. i.e.. 5W is better than 350 mW . Battery life is not that important either.

1) What band or bands are best for DXing with a QRP rig?
2) What type of antenna? Long wire di-pole is OK.
3) Most of the kits I have seen are of "older" design. Are these still ok or are there newer designs that I have not seen yet? Are there good designs in the books and magazines that are not yet kits ? Where should I look?
4) Of the kits that are out there, is one better than the other?
5) Is there a QRP rig that is good enough to double in the home shack?
6) Is there a QRP newsgroup?

Thanks in advance for any help that you may give.

OK. Some basic information seems appropriate here:

CI-IV is a parallel I/O port.
CI-V is a serial I/O port.

Some older Icom radios use the CI-IV interface.
/sm6pxj Christer

Thanks Ralph,

I'll start with +/- 4KHz deviation on the TX and 15KHz
IF bandwidth in the RX.

We don't get to pick and choose the frequencies. They are
assigned in the licence. We will be using 600KHz separation.

I still haven't managed to dig up any information about
the KVG S-69-4A filters. I suppose I'll have to measure
the bandwidth with a signal generator/ oscilloscope.

Thanks again.

Pete---

> Started dreaming of QRP transceivers for trips to the mountains.

I've heard wonderful things about Elecraft:

http://www.elecraft.com

The K1 is their QRP CW only offering, capable of two bands stock, or you can order a four-band kit (you specify which bands in the two-band stock module). The K-2 is for more advanced kitbuilders, and offers (I believe) all-band SSB operation.

As for the antenna: as far as portability and effectiveness, the best bet is a full-length half-wave dipole up as high as you can get it. If you can put it up half a wavelength, you can feed it with a half wavelength of twinlead without having to build a 4:1 or 9:1 balun. To extend the length of the feedline, simply attach a coax pigtail. The nice thing about using twinlead is that it tends to be lower loss _AND_ more compact than coaxial cable. Check out the article on the portable 20m dipole in the Feb '02 QST.

Good luck,

Henry C. Gernhardt, III

Source record: 46341

I'm looking for information on this unit made by American Time Products, Bulova Watch Co. Inc. Using a 1.915.2MHz crystal it ouputs frequencies of 10, 20 40, 60, 80 100, 120, 140, 160, 180, and 190 Hz . It also has the following stamped on it 6625-00-649-4279 Calibrator, P/N TS65CFMQ1-D10104, DAAB07-80-C-1448, It's in an 6x8x5 inch box., made in the early 1980s. I guess it was used as a frequency standard to calibrate some kind of time piece or other device. Can anyone share any info?

1400. Lithium Ion Battery charging circuit design?

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-16 16:00:36 UTC
From: owner@pa-sitrep.com
Message-ID: <3c6e817c.171120976@news.city-net.com>
Source record: 46342

Hello all,

I have access to some used lithium ion batteries but have no way to charge them. I know that you can't use a regular charger because the batteries can explode.

Does anyone know where I can find a schematic to build an ic controlled charging circuit for lithium ion batteries? I've tooled around on the internet looking for some plans but so far I haven't had any luck.

THanks.

Has KVG changed their numbering system in recent years? Because
that number doesn't look like anything I recognize. I just remembered
that there is a list of KVG filters in the ARRL Electronics Data Book
(admittedly, a quarter century old), and all the filters listed
start with XF. The number that follows is the IF frequency, and
then there's one or two letters that denote bandwidth (and there
seems no patter).

So XF-9D is a 9MHz filter with a 5KHz passband, and a XF-107B is
a 10.7MHz filter with a 15KHz passband.

I haven't seen a list of KVG filters in recent years, so maybe I've
missed a changeover to a new numbering system. But perhaps you haven't
found data on this filter because it's a non-standard type? Maybe
it's a house number, and the filter came out of, or at least was
intended for, a specific piece of commercial equipment?

There's nothing like finding unindentifiable crystal filters.
I picked up some sort of commercial board some years back, and
the crystal filter looks like it might be a good one, but there's
not even any markings on it.

Henry was right about the Elecraft stuff - actually, tho, the K1 is available in 2 and 4 band flavors out of the box and can be upgraded from 2 to 4 bands if you already have the 2 band version. On the 4 band unit, you specify which 4 bands when you build it, on the 2 band unit, you specify the 2 bands when you buy it. On the 4 bander, there are some limitations on combinations of bands.

The Elecraft rigs are pretty much high end rigs ... the 2 band K1 is almost $300 stripped, over $400 reasonably equipped. The K2 is even fancier, and the SSB is actually an option.

The K1 does have an internal battery option which is pretty nice for backpacking.

A lower priced option is the Small Wonder Labs SW-xx+ rigs. These are single banders in the $100 neighborhood. If I recall, these are in the 3 watt neighborhood. I can tell you from practical experience that there really isn't much difference between 5 watts and 3 watts. On some rigs, tho, particularly the K1, 3 watts can be a lot more battery-friendly than 5. I can operate my K1 all weekend on a set of AA nicads at 3 watts. But at 5 I need to drag along a gel-cell. However, with the big ol' gel-cell, I can go a week if I'm not transmitting a lot.

I would encourage you to graze the archives of the QRP-L reflector at http://qrp.lehigh.edu/lists/qrp-l/. The choice of bands, antennas, etc is very much dependent on exactly what you do and what you like. Personally, I like 20 because you can easily throw a dipole up in a tree, and it's a very QRP friendly band. However, if you hike during the day, and do your operating late at night in the winter, 20 might not be so much fun! Some people really like 30 because of no contests. Others like 15 or 10 because the DX is better, but it's open less of the time. There is a TON of information in the QRP-L archives about all this stuff ... unfortunately, there's a lot of stuff to cover and for any one topic it's not very dense. It's much easier to find stuff on the QRP-L CD, but that's hard to get these days.

Another great place for input on portable equipment and backpacking is the Adventure Radio Society, http://www.natworld.com/ars/. This is a group dedicated to your topic. They have pretty extensive tests of all the popular QRP rigs. Keep in mind, tho, that many of the better rigs (the Red Hot 20, or the DSW-20 for example) are hard to get, and you may need to try to find one used (QRP-L is a good source for that if you are quick!)

Hope this helps

..

Melissa,

In all fairness, you might find that more people are willing to pay
more money, if the quantity offered is two or more.

Check your app notes to see how many designs are push-pull.

Then consider the problem of maintenance spares when considering the
employment of old products.

I think you could add info to your ad, indicating that more parts are
available to the winning bidder only, by pre-arrangement, or something
like that.

Back by popular demand! This Wednesday February 20th the CCA will be sponsoring a low power AM night on 3880kcs.

We will be looking for 100 watts or less. Things like DX-60's, Knight T60's, Gonset G77, Harvey Wells T-50s' Multi-Elmac's etc.

REMEMBER you DO NOT have to be running Collins gear to check in. Everything is welcome!

Each ncs will start at 08:00pm in their time zone.

We will have 4 main ncs. One on the East coast, Midwest, Mountain area, and West coast. The main ncs will have others in their area helping with their hour. (Please note ONE HOUR). At the end of their hour the main ncs for that region will contact the next regions ncs and turn ncs over to them etc.
etc. etc.

Starting at 8:00pm EST (01:00 UTC) Bill K2LNU ncs will start the net
At 02:00 UTC East coast ncs will turn ncs to Midwest ncs
At 03:00 UTC Midwest ncs will turn ncs to Mountain ncs
At 04:00 UTC Mountain ncs will turn ncs to West coast ncs

comments please to wa9vrh@ocslink.com

Visit our website at www.collinsradio.org for more information on AM activities.

Have fun and enjoy the great sounding AM signals. 73's Larry WA9VRH

Sounds like a good idea but I already have a bid on that auction and can't change it now.

I was also trying to sell my CD of Microsoft Office 97 Pro on Ebay but they went and canceled my auction today, I'm not sure why yet, and it sounds like Microsoft is pulling the strings. The thing is, it was a legal copy (not pirated) that I bought on Ebay originally, used for a few years, then just deleted from my hard drive and wanted to sell. Doesn't Microsoft allow ownership of their software, or allow me to sell something I legally own? This stinks big time.

As I mentioned before, I'm working on a better handheld antenna for better performance than my trusty 2m/70cm RD-98 antenna, yet retains much of its convenience. This antenna would have an SMA connector and radials.

The RD-98 antenna is VERY flexible but manages to retain its shape. If you apply pressure to the antenna, you can bend it into a curve. You don't have to worry about breaking it. Although the antenna is 17 inches long, I can compress it substantially. But in spite of the flexibility, the antenna retains its shape. If you let go of the antenna after bending it, it bounces back to its normal vertical shape.

How can I get a piece of wire to exhibit the same characteristics as my RD-98 antenna? The antenna is wrapped in a black plastic/rubber material. I would like the vertical element and radials to have the flexible-yet-shape-retaining shape. Does anyone know what material would give a thin wire (#18/20 solid copper) such properties?

The normal charge regime for Li-Ion and Li-Polymer types is current limited constant voltage. Charge termination is on current_draw_reduction, timer, or both.

There are some ASICs for single and multi-cell Li charging. Look up MAX1737, LT1511 and UCC3956 for starters.

The precautions required for Lithium-Ion/Li-P types are:

(a) limit charge voltage to spec (typically 4.1 - 4.2 per cell - refer manuf data)
(b) limit charge current to manuf figure - can vary from 1C up to 2C and beyong for latest types.
(c) limit discharge end voltage to manuf figure - use 3.0V as a cutoff if no data available. Below this, risks rise RAPIDLY.
(d) limit discharge current to manuf figure. Typically 2C is what I have seen.
(e) limit operation to 0degC to 50degC, esp charging.

There are ASICs for on-pack protection modules which cover (a) to (d). Look up Mitsumi MM1414 (4-cell) and also Seiko site for 1-2 cell configurations.

Source record: 46261

Pete,

>1) What band or bands are best for DXing with a QRP rig?

I prefer the 20m-Band, due to the fact that you'll always find the condx (not only in the sun spot maximum) that allow you to have radio contacts to stations all over the world or on your own continent at least (if condxs are poorer). And the antenna is in reasonable dimensons for portable operation.

>2) What type of antenna? Long wire di-pole is OK.

The dipole ist best for 20,15 and 10 mtrs. This is due to comparatively low losses and an acceptable radiation pattern. But, mind the height of the aerial. Should be higher than half the wavelength you are using.

>3) Most of the kits I have seen are of "older" design.
>Are these still ok or are there newer designs that I have
>not seen yet? Are there good designs in the books
>and magazines that are not yet kits ? Where should I look?

Depends on what you expect: I appreciate the various books that are published by the ARRL: QRP-Notebook, QRP-Classics and so on. If you wnat to do good contacts, it is not neccessary to have a microcomputer-controlled all-frills hyper-expensive rig. If you want to have contacts in cw the circuits are fairly simple. If you want to operate in ssb, it gets a little bit more complicated. But, no problem at all. I have homemade ssb-rigs with 20 transistors and 2 or 3 ICs. That's all you need

>5) Is there a QRP rig that is good enough to double in the home shack?

I use a homebrew QRP-rig as my only station in here my home shack. No problem with my neigbours and rfi. And, lots of contacts on 20 mtrs currently.

> seems no patter).

I have the list of KVG filters from the ARRL Electronics Data Book
and the 1993 ARRL Handbook. As you say, the part number usually
gives a good indication of the frequency and bandwidth.

These filters were used in the first IF of Storno VHF radios
during the 1970's. It is possible that they were custom made
for Storno. They look like very high quality filters. I'm
hoping they will be wide enough for 6M FM.

I will report my findings, after I have made some measurements...

Thanks!

According to Microsoft, you do NOT "own" the software. Apparently,
they think that they retain rights to it after it is sold. This is
unlike books and recordings under identical copyright law. Hmmm. The
more I see, the better I like Linux.

Sorry if I keep coming back to this ... someone makes a comment and I think of something else...

You said:
> >3) Most of the kits I have seen are of "older" design.

I guess I wonder about that comment. There is a pretty big difference between the popular commercial rigs and most of the QRP rigs. The Yaecomwoods were designed to be all things to all people. They have a long list of features and frills that are sometimes nice, but make them complex to use. These features also make them power hungry and expensive for the performance level. The various QRP rigs generally have specific design points that are pretty focused. Each QRP rig out there has a particular audience, and many are the best around FOR THAT PARTICULAR PURPOSE.

Take the NorCal/Red Hot NC-20. This is a rig designed to have a dynamite receiver. It will NOTICEABLY outperform the $1000 category rice boxes in crowded situations at a tenth the price. I haven't had the pleasure of using a $3000 Yaecomwood, but the specifications indicate that some of them should have receiver performance similar to the NC-20.

However, the NC-20 sacrifices receive power consumption in order to get that performance. It uses almost twice the power of the K1, which could be an issue for backpacking, and the K1 is at the high end of most of the QRP rigs. Still, it's only just over a tenth the receive power use of an Icom 706.

I have a 706MkII and a K1 here in the shack. I use the K1 at least as much as the 706. There are some 706 features I miss on the K1, but the K1 has a couple of features that the Icom doesn't, and they are more important to me. The K1 has about a dozen items on it's menu, compared to, who knows, 100?, 200?, on the Icom. This makes the K1 a much more pleasant radio to operate.

Most of the QRP rigs use an SA602 or 612 mixer. This can be pretty bad in crowded conditions. In the K1, Elecraft took a lot of care in how they implemented it, so the performance is pretty similar to the 706. There are a lot of rigs, particularly with lower receive power consumption than the K1, which are going to suffer badly from IM. This isn't a huge problem on 20, but it can be on 40, and of course it's a disaster in Europe. But if you're going to be operating from the wilderness on 15, it just doesn't matter. Having less weight and fewer batteries is much more important.

So yes, rigs like the SMK-1, the Pixie, and the very low end rigs are going to involve a lot of sacrifice. But they are very small and lightweight, and very inexpensive. Probably, if I were to take a radio on a canoe trip, I'd be more inclined to take a $30 radio than a $1000 radio, even if it meant I

sacrifice a few frills.

So there really isn't a 'best' rig, but there may very well be a best rig for a particular set of circumstances.

One of the very nice things about the QRP kits is that the schematics are almost always online. You can download it, study it, compare it to the others, understand what design tradeoffs were made, and pick the rig whose designer most closely matches your preferences.

Peter indicated he uses a homebrew rig in the shack. If you're up for a bigger project, take a look at K8IQY's 2N2/40. It's hard to find a better performer on 40 meters. Yes, it's feature-poor, but it's homebrew - you can add what features you want. Looking for something a little simpler? K7QO has a series on homebrewing an SW-30+. There's no thrill like that first QSO on a homebrewed rig, but it is a LOT more work than a kit. On the other hand, it's easier to add the exact features you want and come up with a personalized radio that, FOR YOU, is the best possible.

Alot depends on the features you want.
The Optimized QRP transceiver by Roy LeWallen (excuse me if I didn't get it
right Roy) I think still stands the test of time. Excellent for design ideas
too.

Check out the K1 & K2 from Elecraft, http://www.elecraft.com/

QST periodically reviews QRP rigs/kits

I think one of the main rig manufacturers makes a QRP rig as well

>
> 4) Of the kits that are out there, is one better than the other?

You had better define your criteria here, eg.
sensitivity
dynamic range
selectivity
tx power
battery drain/life
"features"

for a few

>
> 5) Is there a QRP rig that is good enough to double in the home shack?

Depends on the performance you want in your home shack.
If you have a lot of other hams near buy, you might want a rig with good
dynamic range & intermod performance.

Some of those QRP rigs cost more than a regular rig, with receivers like those direct conversion QRP rigs of yesteryear. On the Cheap, I'd buy a used ICOM 735 (Limit the drive for QRP) and spend whatever's left in your budget on the antenna and rechargeable Lithium Ion Battery pack. In a "DX Crunch", you can wail on the drive and break thru for the initial contact. Some would call this QRP cheating, but as long as you maintain contact at QRP levels it might be considered legal (by some). Good news with Lithium Ion's is that they can be directly paralleled without problem (Unlike NiCd's). Each cell is 3.7 Volts (4.1V charged, 2.8V discharged), and a "D" cell is >4 Amp hours. Stack 4 in series (If you think a 735 can take 16 Volts), and 4 in parallel, we're talking >48 watt hours in a relatively small pack. With a proper charger (per cell constant current, then taper), you can recharge the pack from a cigarette lighter in an hour or so, or even a small Solar Array. Most say that each cell "Layer" should be charged independantly, although Maxim, Linear Technology, and TI make charger chips for LiO cells. A GaAs array puts out about 180W (+/-) per square meter in full Sunlight. Problem with Lithium Ion's is cell reversal which is caused by excessive discharge. Once they reach 2.8V they're functionally dead, and further discharge could wreck or severely life limit the pack. Discharge limiting the pack to 3 volts per series cell (12V for a stack of 4) should be safe.

We're talking QRO QRP on the cheap.

Hello,

I have several of this antique globe shape German triode in stock. It
is directly heated, an European 4-pin base and about 12W anode
dissipation. The valves are NOS, but the boxes are mostly in bad
shape. Pictures are available by e-mail.
Please contact me if you are interested.

Regards,

Arnold Goksyr

DEMOSTENES - N6899 Balestrand, Norway
Tlf. +47 5769 1340 Fax +47 5769 1267
http://www.demostenes.no

Thousands of different valves in stock as well as
sockets,transformers,books,caps,resistors and
other components. Web site is updated every week.
You can order on-line.

One problem with this is software like Outlook Express, that always puts the sig and cursor at the top, when replying. I get fed up cutting and pasting every time I post a response.

This scope had been operating flawlessly until I left it on for a whole week, I normallly turn it off after I use it. It passes all its self test 100%. But when connected to a 100 KHz sine wave it messages "no signal found" and I see a broken sine wave pattern that can be changed somewhat by pushing sideways on the vertical postion control. This control can be rotated 360 degrees several times and it moves the base up and down and pusing it sideways affects the brken trace. It does this on all 4 channels and the probes are OK. Some time ago I lent it out and the guy arced one of the probe tips and I'm wondering if this could be thie cause?
I've not looked inside and wonder if anyone has any suggestions?

Yeah, I use OE also, but the cutting and pasting prompts you to cut out
everything except what you are responding to.

Be careful talking about OE, in many circles (dunno if this is one of them!)
it will get you flamed for not using a "real" newsreader. (I suppose they
mean those clunky old text-based things from the 1980s!)

"Common as dirt"??? I certainly haven't found them anywhere in the
last 15 years, but I certainly haven't looked everywhere. I remain
hopeful that a source will surface somewhere. I think a lot of cars
use a festoon bulb as the dome light, but all the ones I've seen have
a glass bulb that is larger in diameter om the center than the end
contacts.

The bulbs I'm looking for look just like a pointy ended fuse: a
straight glass tube between the two end caps. The socket does not
resemble a fuse holder, however, so the more modern fuse lamps will
not work in there, they require the pointy ends.

They do special orders for what they don't have in stock. I recall
seeing ones like you describe in auto instrument panels too.
As a last resort...could you build up and file down some solder on the
ends of a regular fuse lamp? Would it fit?

How much loss should I expect to see in a WR90 to SMA waveguide transition? I would like to insert a low noise amp into a waveguide section, and my amp is SMA in/out. the transition losses will be greater than my amps gain I would suspect.

I knew somebody would quickly mention Free Agent. I tried it and its
great for downloading binaries, but for regular news reading, I guess
gave up on the learning curve. I'll stick with my Newsreader For
Dummies, Netscape. Free Agent is nice and versatile if you like that
kind of thing to play with.

1448. Re: QRP kits/homebrews

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-18 04:35:57 UTC
From: cooperjim@aol.com
Message-ID: <20020217233557.10837.00001913@mb-fs.aol.com>
Source record: 46290

Hi Pete

I have an Emtech NW40 that I Iike and just received the kit for the NW20. The web site is

emtech.steadynet.com

I have found that there is usually someone on 40 meters most of the time. Mostly west coast during the day, but at night I can cover the country with 5 watts.

If 20 meters is open, thats great, but its not always open. I am getting the NW20 to go with my PSK20 so I will have a CW/digital station hi hi. And go after DX when 20 is open.

A dipole antenna works great and if you have room go for it. I dont have room for one so I have been using magloop antennas. They work very well and they are small (5 foot diameter for 40 meters), but too heavy (uses copper pipe for the loop hi hi) and bulky (cant break it down) for backpacking.

The Emtech kits are nice, but they have some loose ends. Get a bunch of star lockwashers and use them when installing hardware. The board standoffs are a bear to install, I superglued them to the chassis which made it easier (doable?). Getting all the oscillators on the right side can be tricky. You cant turn off the RIT for true transceive without modification and the obvious one of shorting the RIT pot with a switch does not work well. (There is a JFET whose gate starts conducting current when you dont want it to.) I have posted a mod on the Emtech forum that improves the RIT problem (from 2 KHz to 200 Hz) but does not solve it.

The rig is clean and steady with very little drift. I like the variable bandpass crystal filter with the audio filter. It is easy to copy CW.

I got the NW20 in less than a week after I ordered it on line! Surprised me!

All the kits people have been talking about are good. The Elecraft has a great reputation, but is a bit too costly for me at one gulp.

Hope this is of some help.

Got a question I should know the answer to but dont.....if a switch is rated @ 3 amps with 120VAC.......what would the rating be @ 12VDC? I'm thinking 30 amps (amperage times voltage = wattage, so 3amps X 120 VAC = 360 watts...........360 watts divided by 12 volts = 30 Amps) is this correct? Thanks for any help

I think you would be best to stick with 3 amps at 12 volts. Switch
rating is normally a function of the contact size (ie resistance) and
the voltage rating isn't an issue when going lower.

It is still 3 amps. It has to do with the contact area and how many electrons it will carry.

Look at it as wire size. For example a #10 wire is rated at 30 amps regardless of the voltage is being used.

But most of them skimp on the A/D converter used for incoming signals.
Look at high end sound cards before you make a decision. I have one
made by TeraTec that costs about $75 (DMX Fire 1024) that has excelent
incoming A/D converters. They, and other vendors, have much better cards
selling for around $150.

Most all the new ones do. The older icom HM-7 hand mike used a dynamic element with a preamp in the mike. But the desk mikes made at the same time were electrets.
>
> >Others like kenwood build the mike preamp inside the radio.
>
> ...Because they use ordinary moving-coil (dynamic) elements with a
> lower output.

Well, in the radio or in the mike, they both need the mike preamps . I think the only reason a electret condensor is driving the newer icoms is they are using quite a bit of voltage on the elements to get a lot of gain.
I never could understand why icom wants the mike preamp outboard. Kenwoods method is much easier. Almost any mike will work as is on a kenwood. You need less preamp gain with a new icom than an old one though. My dynamic mike will drive the 706 to about half power on it's own. On my old 730, I bet it wouldn't do enough to move the meter without a preamp. I also run my preamp on the radio mike voltage. It's also very simple, with only one transister and a few parts.
I've also built them using 741 op amps and a few parts. MK

Don't overlook that on AC (60 cycles) the current turns itself off 60 times per second compared to the unidirectional flow on DC. Therefore the lowered voltage on DC is going to probably burn the contacts long before you get to higher amperage.. VE7AFN.

Well, I've been toying with the idea of wind turbines for a while, since it always seems to be windy when I'm trying to get an antenna up. I finally got inspired while dismantling a salvaged 5.25" floppy drive, and built this:
http://www.kd5nrh.net/EmPower/windturbine.html

Of course, it's more of a working model and ongoing tinkering than anything terribly useful, but what the heck, I'd like to at least give it something practical to do until I get around to building something more powerful, so...

Is there a simple charging circuit out there that would allow me to charge a batch of NiMH AAs consecutively? Specifically, I'd like to be able to put, say, four batteries in it and have it charge one, then when that one's charged, start on the next, and so on. I'm fairly certain I could rig this up with four charging circuits, but I'd like to minimize part count, while still keeping it practical for later use with higher current (and voltage) sources.

==========
For a universal homebrew mike/amp unit I would suggest you have a look at
QST Dec 1991 ,pages 26-27.

'A Quality Desk Mike for under $25' by Ron Klimas , WA1VRH.

Basically it is an electret element ,its signal amplified by a dual opamp
with adjustable gain .

It is powered by a separate 9V battery which is switched on/off with the PTT
.

With many transceivers nowadays having 9V or more available from the
multi-pin mike connector ,the separate battery wouldn't be necessary.
Also ,the unit can be made so small that it could be readily fitted in an
old handheld mike enclosure (ex CB ?)

For those not being able to trace the above article ,I'll be happy to send a
scanned image.

Consider them two different ratings. Look at it this way: when the switch
is open, the current is zero and the voltage rating is the only one that
matters. Try to go past 120 volts, and it might arc over. (especially when
you try to change the switch from open to closed or vice-versa)

When the switch is closed, the *voltage* is zero and the *current* rating is
the only one that matters. Try to go past 3 amps, and things get hot.
Something might melt, or in extreme cases, catch fire. You're also likely
to damage the contacts when you try to change the switch from open to closed
or vice-versa.

(even if the switch is always closed, you do still have to worry about the
voltage rating. Because it could arc from the contacts to the handle or
frame of the switch. I doubt that would be a problem unless you gravely
violated the ratings, by running 1,000 volts or more.)

Careful!!!! Often times the DC current rating is less than the AC current rating. No way would DC current rating ever be equal to AC current rating. Check the switch specs..

As others pointed out 3 amps max at any voltage and 120 volts max voltage.

The switches (and most other things with contacts such as relays) are rated for resistive loads. If inductive loads are used the contacts could have to be derated by as much as a factor of 10 for highly inductive DC loads. The inductive DC loads tend to cause an arc to be created and maintained. An AC supply will tend to not have as much of an arc.

==========
Suggest you construct a 500 mA ,pulsed charger by means of a LM317 or LM7805 as a constant current source and an 'upstream ' 78xx ' device (or power transistor used as a switch) with a NPN transistor in the common lead ; the transistor being pulsed by a 555 timer set at approx 1 sec on , 2 secs. off (not critical).

Ideally a negative dV/dt detector is included (an opamp used as a differentiator) to stop pulsed charging when battery voltage tends to decrease (this is when battery is fully charged), followed by 10 -20 mA steady trickle charge (unlimited time).

Alternatively include a diode bridge opamp circuit with 1 diode used as temperature sensor strapped to battery. The other diode used as an ambient temperature reference
Pulsed charging should stop when battery temperature increases to a few degrees above ambient.
Followed by trickle charging as per above.

Alternatively include a 'few hours timer' ,say a 555 device ensuring a non-electrolytic capacitor is used to determine steady timing, and set time ,for pulsed charging ,such that battery temperature does not increase more than a few degrees above ambient. Again followed by trickle charging .
Note : For different battery capacities one should determine the different timing periods.

Of course all these operations can be done by a dedicated 'chip' , but for a homebrewer the 'separate components' route can give a satisfying result.

Good Luck

Mark brought up a few things...

"Mark Hall" <vze2mhvc@bellatlantic.net> wrote in message
news:3C6FF4BA.723EF544@bellatlantic.net...
> Some of those QRP rigs cost more than a regular rig, with
> receivers like those direct conversion QRP rigs of yesteryear.

Nowadays, only the very low end QRP rigs have DC receivers, and that is
something I would avoid.

BUT, some of those old DC rigs have quite a following and the used price
can be all out of proportion to the performance. The HW-9, for example, was
quite a nice rig in it's time, but newer radios will run circles around it
at a much lower price.

> On the Cheap, I'd buy a used ICOM 735

This I wouldn't do. All but the very low end (under $50) QRP rigs these
days include crystal filters, a must-have on today's bands. The crystal
filter for that 735 will cost more than many QRP rigs. And realistically,
if you are going to run any of the 100 watt rice boxes off batteries you
better be thinking in terms of lugging a car battery.

On the other hand, I have a number of rigs. As I mentioned earlier, I
probably use my K1 more often than my 706, and my 2N2/40 has a better
receiver than either, and my NC-20 better still.

BUT - if I were limited to only one radio, I'd probably choose the 706.
(In fairness, tho, I bought it a few years ago and paid three times the
price of the K1, today it's probably only twice.) The reason is that the
706 is very flexible. None of the other radios are reasonable to take
mobile, the 706's removeable front panel is a big win there, the 706 has VHF
so when I do take it mobiling, I don't have to take a separate 2 meter rig,
the 706 is the only rig I have for VHF CW and SSB, and once in a while I do
turn up the power, oh yeah, and I really like the DSP. So while I paid a
bunch of money for it, I got a very flexible rig. On the other hand, this
is NOT the radio to take backpacking. The receive current is almost an amp
(compared to 65 mA for the K1) and key down is around 9, even at low power,
climbs to almost 20 at full output).

> Lithium Ion Battery pack.

Can you actually buy cells? I hunted around the web and found nothing, nor
did I find anything at any of the normal electronics houses. It was my
understanding that manufacturers were reluctant to sell these except to
certified buyers because of the risk of explosion from an improper charging
circuit. If you go out and buy already assembled batteries, you might as

well buy a car for the price. I calculate almost 2 grand for enough to run my 706 for an evening. I can run my K1 for a week off a $50 gel cell, probably run the 706 for an hour if I do any transmitting at all.

..

From: jflanders2@home.com
Message-ID: <3c71bb44.203427980@NEWS>
Source record: 46211

I am getting a Yaesu Quadra amp to use with my IC-756PRO exciter. I know they can be used together, and lots of guys are doing so. BUT - I have not heard of anyone making up a band data interface to go between them to set the quadra to the band the PRO is on automatically. It appears that most of the guys let the quadra count the freq to set it up, and others set the quadra manually.

It appears that a LM3914 in dot mode and a set of diodes in a matrix is most of what is needed for a true band-data interface. Has anyone tried to set this up?

My copy of Operating and Service Manual for HP5245L refers to the timebase oscillator employing *a 1-Mc piezo electric crystal*. There is a x10 multiplier circuit to generate a 10MHz signal for the rear panel *10-Mc out* this 10MHz is also used in the various plug-in units that were available.

For the standard timebase the stability specs are given as:
Aging rate - less than 3 parts in 10^9 per 24 hours.
Short term - less than 2 parts in 10^10 RMS with measurement averaging time of one second under constant environmental and line voltage conditions.

Not bad specs for it's era, I guess.

I don't know how this compares with your version of the 5245.

Epoxy putty is a good solution for your problem.
I realize that you don't think that you want a putty consistancy, but it's
easier to work with in most cases.

1474. Re: QRP kits/homebrews

Newsgroup: rec.radio.amateur.homebrew

I believe the R2 receiver by Rick Campbell obtains pretty respectable side band rejection for a direct conversion receiver. In this case two receive chains are used to generate what we refer to as I and Q channels (Inphase and Quadrature). By suitably combining these two channels together one obtains either the upper or lower side band. I believe the R2 is in relatively recent ARRL handbooks.

Here is a reference from a quick search on the web.:
http://engphys.mcmaster.ca/~elmer101/r2atxt.html

The R2 is indeed a direct conversion reciever, suitable for anywhere between 1 Mhz and 500 MHz as is, more or less. You have to provide the LO and the RF 90 degree splitter for the band you want to actually use it on.

==========

This website has a kit for the R2. At the moment, it shows the miniR2 as avaliable and I am still waiting for it to show the NEW R2PRO which according to the website has even better performance.....

http://www.bright.net/~kanga/kanga/kk7b.htm

Here are a couple of websites where the R2 was connected to a DSP system which allows multiple modes and other sophisticated tricks. 'Way beyond the needs of a "simple" homebrew rig, but a very interesting idea.

http://www.wwc.edu/~frohro/R2_DSP/R2-DSP.html

http://www.apriori.net/~paz/r2dsp/r2dsp.html

==========

Still, for a good dynamic range homebrew, the basic R2 or miniR2 are hard to beat especially considering how easy it is to set them to anywhere between 1 Mhz and 500 MHz. Add the T2 transmit board (on the Kanga website) and you have a basis for a very compact SSB or CW system.

The discussion arose because this particular 5245 seems to have a
10544 oven oscillator. No 5245 that I have seen has that
configuration. The 10544's that were used in HP equipment that came
(to my knowledge) a bit later than the 5245, all had 10 MHz output.
The 5245 that I have has a 1 MHz crystal in a cylindrical oven with
an external oscillator board. As you mention this is followed by a
board that multiplies the 1 MHz up to 10 MHz. I think this is the
standard configuration as you were describing.

The particular 5245 of the OP seems to be unusual in that it has a
10544 for a timebase, and that 10544 is unusual by having a 1 MHz
output.

The poster wanted to use the timebase - out of the counter - as a 10
MHz reference. It's been pointed out that even a standard 10 MHz
10544 wouldn't be that great compared to more recent 10 MHz
oscillators.

Just trying to clarify what we were talking about.

Hope I'm not teaching my grandmother to suck eggs but I used to find
standard (2 tube) epoxy would do just this if you gently cured it with heat
after joining. I used squeeze hardener & resin onto piece of card, warm
gently under a lamp for 2-3 minutes until they both became clear & runny &
then apply to the joint. If you continued to cure the work piece (put 2-3" in
front of 60w bulb) any bubbles formed in the mix would float to the surface
while the mix was still liquid & before it set hard & clear (1 hours curing was all
you needed). Maybe they've improved (!) epoxy cement so that it doesn't
behave like this nowadays .... Ah well, back to that vibrating coherer that
needs fixing ..... !!!!

Hi,
When I worked in satcom we used a lot of these with WR-75. The loss
in the transistion was minimal (<1dB) assuming a well made transition
and flanges. The flex coax that was frequently used from the SMA
connector was the real killer. We used pretty good commericialy made
stuff and found a 3ft length had about 2.5dB loss at 14GHz.
.144" semirigid did much better.

A connected switch can be compared in this context to a piece of wire.

If a piece of wire is rated 3 amps with 120VAC, what would the current
rating be at 12VDC? (Clue: can a #30 wire handle 30 amps when you use
it at low voltage?)

Your guess is as good as mine. The filament may or may not be enclosed
in its own sealed glass tube and the ends are just tacked on....you
might be able to glob on some solder without heating it too much.

> > Got a question I should know the answer to but dont.....if a switch is
> > rated @ 3 amps with 120VAC.......what would the rating be @ 12VDC?
==========
The switch contact current rating is a matter of maximum permissible
AVERAGE current.
The average amplitude of a sine is its peak value divided by PI.

So when the AC contact rating is 3 Amps this is the rms value of the current
,its peak value being 1.41*3 equals 4.2 . Hence the average value is 4.2
divided by PI equals 1.34 Amperes .

So the contact rating @ 12 V-DC would be less than 1.4 Amperes (valid for a
purely resistive load)
With an inductive load the induction voltage occurring when the contacts
open , will make it necessary to further de-rate the contacts ,unless the
contacts are bridged by a suitable capacitor.
Example : A (now old fashioned) petrol engine ignition coil/ contact
breaker system .

post.

Welll...it depends on the group.

Some groups insist on top posting, others insist on the bottom. Both quote
netiquette...so take your pick.

The common sense approach, is to instert answers to questions, or statements
below each statement instead of top, or bottom posting.

> > However, more than one good flamewar has come out of discussions
regarding
> > this practice... :-)

Some get down right hostile. One such group is supposed to be to help
newbies on the net, but ... <:-))

>
> One problem with this is software like Outlook Express, that always puts
the
> sig and cursor at the top, when replying. I get fed up cutting and pasting
> every time I post a response.
>

Check...I know the earlier versions gave the options of either top or
bottom.
I haven't been able to find any option in 6.0 and up. My version is 6.02.

As for those who say get a real reader...Use what ever you want, what ever
is handy, or any other reason you care to use.

The reason so many viruses, worms, and scripts show up in IE and OE are
because they are the most used and the writters expect to get the most
mileage by writting for them.

Above all Include enough of the post being answered so people know to whom
you are talking. Far too many assume that the order in which the posts fall

should show should show the posting order. If they really do fall in order
it is just by accident, or the posts were all made on the same server. It's
not uncommon to see the question follow several answers in many newsgroups.

Gil, as W2OPB 44 years ago when I was 13, I made keys, especially bugs. I used to make them out of pine boards, brass shim stock, Erector Set parts, razor blades and popsicle sticks. There was an article in QST in the 50's by Katashi Nose, KH6IJ, on how to make a bug and if anyone out there has the article I'd pay for a copy. I have made a few sideswipers lately out of hacksaw blades:

http://www.qsl.net/aa1ll/sswipe6.jpg

The thread to the NB6M key is good--it might make a good sideswiper:

http://www.fix.net/~jparker/norcal/paddle/nb6m.htm

Keep in touch about making keys!! Use aa1ll@email.com

> greater than my amps gain I would suspect.

The transition loss would probably be less than 0.5 dB at 10GHz. If you connect the amplifier input right to the transition without cable you won't suffer more than a dB increase in noise figure, and if you have say 15dB gain, the transmission line dissipation loss (<2dB) of coax several feet long won't impact your system NF more than hundredths of a dB. Make sure you have adequate amplifier gain and of course real good noise figure.

There may be an impedance matching issue at the input of the amplifier--an LNA's noise figure is usually sensitive to source VSWR which in your case will include maybe a 2:1 mismatch for the waveguide plus transition cascade, or worse, depending on what the w/g is connected to. You may want to consider a tuning screw, which some transitions have, between the coax transition probe which sticks into the WR-90 (E-field probe) and the waveguide end. The screw could be like a 2-56 at lambda/8 from the guide end wall. You braze a 2-56 threaded brass bushing onto a hole drilled in the WR90 .900 inch dimension. No real need to silver plate; copper oxide is a fine dielectric--just clean it before use. You can actually make your own transition, they're not difficult if you're narrow band [<2%].

>The transition loss would probably be less than 0.5 dB at 10GHz.

Lets assume that you have a good preamp < 1 dB NF. Its no doubt
going to be a microstrip design. Somehow you are going to have to
couple the signal into the input microstrip. Assuming you have some
kind of horn antenna or feed into a waveguide, you are going to have
to couple the signal from the guide to the microstrip. This will no
doubt be via a probe into the guide connected to the microstrip.

If you build a custom design with the preamp bound to the guide, as
good as can be, you will have some minor loss (<< 1 dB). If the
standard waveguide transition is designed well, using that should
only differ by the loss from one or two sma connections. This is
pretty small if the parts are good and I wouldn't worry about it.

I suppose there is some way you could tweak things for the best
noise figure match, but if there was an advantage vs. 50 ohms it
should be small and a bit of tuning on the transition may do as
much.

So the preamp will definately help if it has a decent noise figure
and moderate gain. A standard transition should be fine if kept
close to the preamp with minimum connections.

I posted this question to comp.lang.visual.basic, but haven't got an answer yet. There are enough people that read this group that I thought it would be worth a try...

What I would like to do is capture input to the sound card and import it into Microsoft Excel, possibly with a Visual Basic macro.

I have seen how to access the sound card, and how to write macros, but nothing on how to access the sound card from a macro. Or am I just not using the right words in the web browser?

(My opinion of the web is that it is like a huge library where all the books are not sorted by title or subject, but by each of the individual words inside the books.)

I came across a PICSTART Plus programmer and an EPROM eraser in my stash of "Things I'd like to play with someday". I've downloaded the latest code for the programmer, and now I need to get a PIC17C44 to replace the one in the programmer.

Can anyone recommend a favorite source for PICs (preferrably one that does not have a minimum order policy or a service charge for orders below $25)?

On the same lines, can anyone point me at a low-cost PIC prototyping board?

TIA,
Ed

Thanks Jim! The schematics look great.

I have a question.

Your phase noise appears much better than the Icom in the first two
plots, but it appears worse in the third plot. Here are the numbers:

Plot 1
Icom IC-R7000 first LO synthesizer: -60 dBc/Hz at 500 Hz
KE5FX hybrid synthesizer: -82 dBc/Hz at 500 Hz

Plot 2
Icom IC-R7000 first LO synthesizer: -78 dBc/Hz at 2 kHz
KE5FX hybrid synthesizer: -82 dBc/Hz at 2 kHz

Plot3
Icom IC-R7000 first LO synthesizer: -105 dBc/Hz at 10 kHz
KE5FX hybrid synthesizer: -98 dBc/Hz at 10 kHz

What happened in the third plot?

Best Regards,

Mike Monett

Digikey is one place. They are usually not the cheapest source but
give good service. If you get the -JW (windowed eeprom) version, you
can use it again in the future. Not cheap at $18.12. Here's a
link...
http://www.digikey.com/DigiHome.html

If you put 17c44/jw in the search box it will take you to the
listing.

The 16F628 is a good chip to use for learning. 16F877 is a big chip
for do everthing projects.

Jameco has developer kits and proto boards:

got a tip on how to reduce noise from regulators like 78L05 to
oscillator, you just add a saturated transistor with large reservoir
capacitor at base - in series with the voltage from regulator. Voltage
drop of 0.1-0.2V will improve noise sidebands a lot

Hi John,

I posted a query on the phase noise plots that hasn't appeared in Google yet but never mind.

I figured it out. The resolution bandwidth is 30Hz in the first two plots, and 1KHz in the third. This explains why the ICOM is worse in the first two plots.

In the third plot, both curves overlap until you reach the skirt in your synthesizer, then the ICOM drops faster. That's ok, it's beyond the audio range, so yours should give better performance.

Good work!

Best Regards,

Mike Monett

The R7000 uses dual VCOs, each covering significantly less range (260 MHz per VCO instead of 1 GHz per VCO in my design). In general, lower VCO tuning sensitivity means less noise outside the loop bandwidth.

The other point worth noting is that the R7000 uses a significantly lower loop bandwidth than I do. They actually have a 4.7 uF capacitor across the VCOs' varactors, driven by a JFET charge pump through a 1K (IIRC) resistor. You can see their reference spurs at 5 kHz if you look closely at the 10 kHz/div and 2 kHz/div plots. Overall, their PLL circuit doesn't appear to be as clean as mine, so I'm quieter inside my loop bandwidth (about 1500 Hz calculated) than they are inside theirs (less than 100 Hz?), at least as far as my analyzer can resolve.

Because their (relatively) narrowband, discrete-component-based VCOs are quieter than the plug-and-play Mini-Circuits parts I use, they perform better at offsets that are significantly outside both our respective loop bandwidths. At about 3 kHz, they start to pull ahead of me, and at 10 kHz and beyond, you are really seeing nothing but VCO noise in both cases.

Using a better-quality (and more expensive, and physically-larger, and harder-to-find) VCO would enable me to beat the R7000 across the board. The current level of performance is good enough for most applications,

though.

Well, the RBW is the same for the pink (Icom) and blue (mine) plots in each case. The 10 kHz plot had to be made with a wider RBW, or it would still not be finished. :)

In all cases, composite AM/PM (mostly PM) noise is determined by subtracting 10*log(RBW) from the plotted values. The real figures on a spectrum analyzer are typically a dB or two worse due to the analyzer's filter characteristics, but most users don't sweat that level of detail.

> In the third plot, both curves overlap until you reach the skirt in

Actually, close-in phase noise is less important for most communications applications than the far-out noise. The former can make your BER a little worse for digital signal recovery, but the latter can degrade adjacent-channel rejection in all narrowband modes.

I'd gladly give up some close-in noise performance in exchange for better performance at 10-15 kHz offsets, but (as my other reply notes) that's really not possible with a cheap, off-the-shelf octave-range VCO. I'm very glad to stand up to the Icom's 10-kHz performance as well as I do, considering how elaborate their synthesizer is by comparison.

It's the ECS 10.7-15B (DigiKey part # X704-ND from
http://info.digikey.com/T021/V2/461.pdf).

Their search links use URL-embedded tokens that expire rapidly. I don't
guess a whole lot of brainpower went into that policy... gee, since we
make money by selling stuff, let's make it harder to refer people to
specific products on our site!

I agree. I'm amazed at the level of performance you have achieved.

I notice the vco is not hermetically sealed. Have you given any
thought to bias stabilization to reduce the close-in noise? It should
be reasonably easy to pop the top and look inside.

Thank you for posting the schematics and the results. I'm sure this
gives a lot of encouragement to others, now that you have shown what
can be done with a handful of parts.

Bravo!

No prob! Once the boards are ready, it'll be trivial for anyone to build a digitally-tunable octave-band source for any range of frequencies between 100 MHz and 3 GHz. That'll definitely open up some interesting RF projects to people who previously lacked the inclination toward the detail work. Hobbyists can stop goofing around with those CATV tuner hacks and build themselves a REAL spectrum analyzer, for instance. :)

The next obstacle to making modular wide-range receiver construction possible is a sharp, easily-reproducible 1st-IF filter design. Tinkering with VCOs is somewhat farther down my list; I can't imagine that the Mini-Circuits OEMs haven't already picked all the low-hanging fruit.

When I plugged "visual basic" and "sound card" into my favorite search engine (www.alltheweb.com), I got 4,814 hits! Not sure if you are having a problem finding pages, or wading through TOO MANY pages? :-)

Wasn't there a thread in this newsgroup just recently about nearly the same topic? Some pretty good refrences in some of the responses.

1509. LC VHF Bandpass Filter for 123Mhz

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-21 05:26:41 UTC
From: paul@paulrowe.com
Message-ID: <bbd01c1e.0202202126.354199f0@posting.google.com>
Source record: 46151

Hi all;

I am designing a simple superhet to cover the aircraft band between 118 and 128 Mhz. I am going to use a NE602 and a MC1350P, but I would like a bandpass filter in the front end (prior to the NE602). Obviously, filter design is not a simple subject, but with the parts I have on hand, I need to design a filter with standard values. When I design such a filter, I always get non-standard values (low pf and very very low nH). I would like to design such a filter using small pf (10-450pF) and standard H (>=.5uH). I am finding that my books aren't helping: Arrl Handbook, RF Circuit Design (bowick), Solid State Radio Design, Secrets of RF design. They all yield strange values (mainly, inductors in the low nH range... which is not feasible).

Can anyone point me in the right direction ??? I know such a filter is possible (I have a schematic for one), and I want to be able to derive one rather than "copying."

sincerely, paul@paulrowe.com

chess anyone? http://www.paulrowe.com/game.cgi

You need to use coupled resonator filters. An old reference
on this is Zverev: Handbook of Filter Synthesis. I know
some of the new books (perhap Rhea) also cover this topic.
If you use "top coupled" parallel tanks, you get very small
coupling capacitors. To avoid this problem, use the dual
topology consisting of series resonant tanks separated by
shunt capacitors. This technique works extremely well
at your frequency. I have built many filters this way and
the component values are very practical.

>very very low nH). I would like to design such a filter using small
>pf (10-450pF)

450 pF is a huge capacitance for this kinds of frequencies, 10 pF is a big capacitance (Xc 130 ohms). You also have to include the stray capacitances, so the actual capacitor would have to be even less.

>and standard H (>=.5uH).

Why do you want to use a standard inductance, since a two to four turn slug tuned inductor should usually do the job, thus a small fixed capacitor could be used.

If a fixed inductor is used, a varactor diode could be used, since it has a lower stray capacitance than mechanical trimmer capacitors. It is important that the tuning range is well below the maximum capacitance of the varactor, thus, several volts of tuning voltage is needed, reducing the interference risk from strong out of band signals from driving the varactor into conduction.

>I am finding that my books
>aren't helping: Arrl Handbook, RF Circuit Design (bowick), Solid State
>Radio Design, Secrets of RF design. They all yield strange values
>(mainly, inductors in the low nH range... which is not feasible).

Looking at page 238 of the Solid State Design For Radio Amateurs and looking at the first 14 MHz filter with the fixed inductor L3 (my estimate it is about 1.9 uH) and 62 pF capacitance. Scale this to 123 MHz by multiplying both the C and L by 14/123 and you get 200 nH (4-6 turns) and 7 pF, which sounds quite reasonable.

Hi Paul,
did you consider a filter on microstrips or coaxial structures ? I
tried a comb microstrip structure with discrete tuning capacitors and
it looks very reasonable for the band you require. Go to
http://mujweb.cz/www/ok1sip/english/grebeh.htm , download the DOS
program from there and give it a try !

Yes, since I have a finite life time I can't afford to wade through
the infinite nubmer of web pages! ;-)

Like I said, I have seen how to access the sound card, how to write
macros (in fact, I have a book on it), but not both at the same time!

Most of the pages that say how to access the sound card from VB talk
about playing wave files, or midi related stuff. All I want is the
raw data points to appear in a spread sheet.

John
A query on the software and the setup of the PLL
I presume if the BW of the filter on the DDS is 15 KHz ie about 0.15% of 10.7 MHz then the PLL steps will be approximately 0.15% of the VCO minimum, ie about 1.78 MHz to give continuous coverage over the range 1-2 GHz. I presume the PLL reference will be divided by about 6 and the phase detector will work at 1.78 MHz with the main divider of the PLL working between 560 and 1120 (or thereabouts, depending on the exact reference frequency) for 1-2 GHz - is this correct? (I have not looked at your C code!)
There will be a bit of number crunching for the controller to do, especially for rapid steps.
For a given frequency step (say 1 Hz) the DDS will have differing delta values over the range of the PLL
Is there an algorithm that could be applied to an embedded controller where the brute force approach (as in a PC) might be difficult?

1517. Tayloe detector as narrowband tunable filter

Newsgroup: rec.radio.amateur.homebrew
Date: 2002-02-21 14:59:40 UTC
From: Richard Hosking <zaprichardh@iinet.net.au>
Message-ID: <3c750a48$0$1339@echo-01.iinet.net.au>
Source record: 46158

Dear all
I am working on mixers with Rod VK6KRG using the Tayloe detector which is a "commutating" mixer using multiplexers.
A proposed circuit has one input and 4 outputs from a Fairchild FST3253 1 to 4 analog multiplexer. The input signal is multiplexed to the 4 outputs by a 1:4 duty cycle clock which switches each in turn. Each ouput is filtered by a large capacitor. In the Tayloe system these 4 signals are fed to an audio phase shift network for SSB detection.
In this system the 4 outputs (which are at phase 0, 90, 180 and 270 degrees at 0 Hz) are fed to a second multiplexer set up in the opposite direction to the first. The clock for this is at the same frequency as the first and the original signal is restored. Of course, the clock for the second set of mixers could be on a another frequency - in this case the result is a frequency conversion with 0 Hz as an intermediate frequency. Both Rod and I have breadboarded this circuit and some interesting results emerge.
(1) Frequencies more than a few KHz from the clock carrier are quite significantly attenuated, with maximal attenuation being 20-30 dB. Presumably the input impedance of the Tayloe detector is maximal around the clock frequency and falls off rapidly on either side.
The filter at audio appears to determine the RF response
(2) This means that the detector exhibits good strong signal handling as off channel signals are attenuated
(3) The original signal to clock relationship is preserved - tuning the input siganl acrss the clock at the input produces the same at the output.
(4) Of course there are some problems - there is carrier feed through and an opposite sideband image.These could presumably be limited by mixer balance. In our prototypes noise was a problem which limited sensitivity
The circuit can be used as a narrowband tunable filter over a wide range.

Some questions:
(1) Has this been done before?
(2) Has anyone modelled or measured the input impedance of the Tayloe detector?
(3) What would be suitable circuits/solutions to overcome the problems of images, carrier feedthrough and noise?

Thanks

Richard

Don't mean to get testy here, but my question was about using
Visual Basic from ***inside Excel***, not C++!!!

Since I said that I have seen how to use the sound card, and how to
write Excel macros, it follows that I **have** done a web search. And
I have seen the site in the link.

Turns out they do have a way to create persistent links at the cost of search speed. Using their 'Send this link via E-Mail' link towards the bottom of the page, you can generate a non-expiring link, in this case http://www.digikey.com/scripts/us/dksus.dll?PName?Name=X704-ND.
Apologies to Digi-Key for calling the intelligence behind their search engine into question. :)

Sounds to me like you just invented the Switched Capacitor Analog
Filter.

Maxim, among others, sells the things in 8 pin dip packages. Look in
the Digikey catalog.

Do a web search on Switched Capacitor Analog Filter. You're sure to
find a bunch of info on it.
